It is interesting to note what the governing bodies of architects (G.B.A.) are doing for their members in the matter of this competition. Are the "G.B.A." advertising in any way that A.R.I.B.A.'s and M.S.A.'s are capable of designing houses and other buildings as efficiently as men trained in other callings! No! Do the "G.B.A." write circular letters to local authorities suggesting that architects should be placed in charge of architectural work, and that if a qualified sanitary inspector is necessary then a qualified architect (no capitals) is desirable? No! Have the "G.B.A." ever made a statement to the effect that the slum areas now being demolished as insanitary were not in every case designed by their members? If so, has this statement ever reached the general public? No!

Are the "G.B.A." too busy discussing questions of academic dress to consider removing all restrictions from members desiring to compete with auctioneers, estate agents, and others on equal terms? The present state of affairs, by which the only man not permitted to advertise himself as an architect is the qualified man, is ludicrous. C. F. OVERY, M.S.A.

Training for Decorators.

SIR,—My attention has been drawn to a report in *The Builder* for October 26 of a speech made by myself at the dinner of the Institute of British Decorators. There is some confusion as to the two points I wished to make. The first was that the trade should make itself responsible for the thorough vocational training due to apprentices. Few art schools are in a position to afford or can obtain the technical instruction needed for mastering the many trade processes. I suggested that it was advisable that an industrial student, before visiting an art school, should have an efficient preliminary craft training. The business of a school of art is to relate this intensive vocational practice to the true values which are common to all the arts, and to broaden the student's outlook on the world.

It was in reference to the criticism I ventured to make on the more ambitious work done by the trade apprentices that I touched on a second point. This was a plea for the most enlightened education possible for the students who distinguish themselves, which should go beyond a mere training in processes. Here artists, professors and teachers can be of signal assistance, and can help the decorator to paint what he means and to mean what he paints.

While hoping that these students, after receiving the more humanistic education our schools of art should offer, will return to the industry, I was careful to point out that we have, happily, no caste system in this country, and the Institute must be prepared, in providing scholarships, to find some at least of its most gifted apprentices aiming at the highest branches of decorative painting.

Royal College of Art. W. ROTHENSTEIN.

Ivy on Somerset Church Towers.

SIR,—A year or two ago I wrote to *The Builder* calling attention to the foolish practice of covering the details of our beautiful old towers with ivy. Your readers will be interested to learn that nine of the towers in question have now shed their coat of ivy. The youngest growth was fifty years' old and two of the oldest were one hundred and twenty years. There is still one famous tower to be dealt with, that is Huish Episcopi, near Langport. This, I hope, will be cleared away by Christmas.

EDWARD VALE.

Weston-super-Mare.

Other Letters.

A letter on architectural competitions is given on p. 770; others are unavoidably held over.

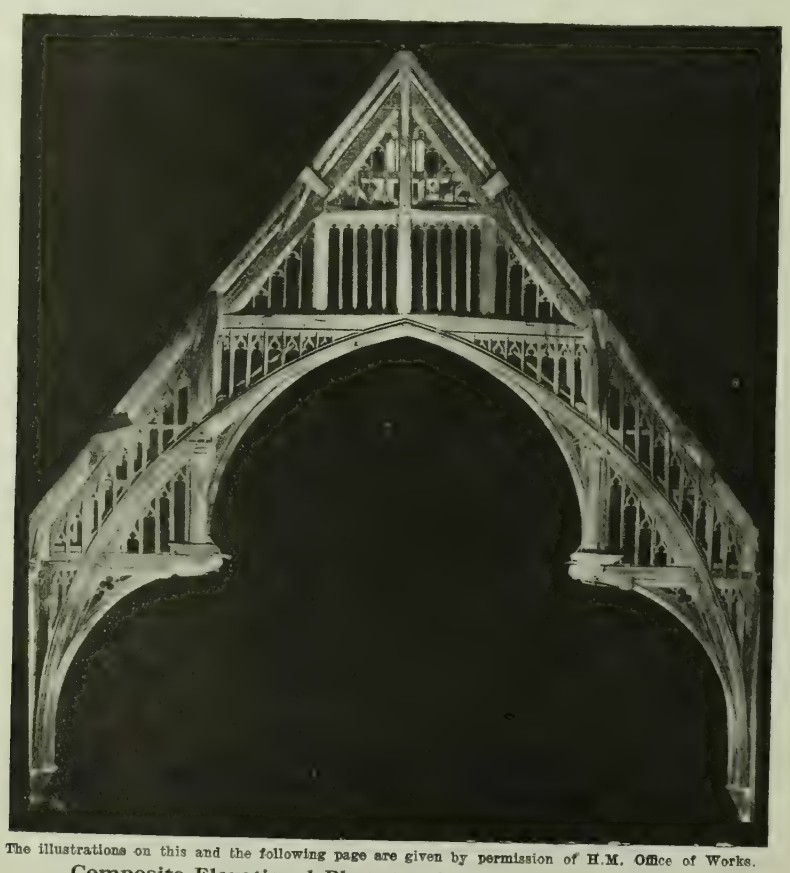
The City Churches.

In a letter to *The Times*, Mr. J. Alfred Gotch, P.R.I.B.A., states that the R.I.B.A. protests against the proposal to demolish any of the City churches and pledges itself to do all in its power to prevent the demolition in the capital of the Empire of buildings which are of great historic value and artistic interest.

Westminster Hall Roof: Terminal Figures to Hammer Beams of Roof Trusses.

WESTMINSTER HALL.

WESTMINSTER HALL, the scene of so many events connected with the English Parliament, was a fitting meeting-place for the members of the Empire Parliamentary Association assembled to hear an account, on Monday, of its history and preservation, delivered by Sir Frank Baines, C.V.O., C.B.E., Director of Works, under whose supervision the recent works of repair have just been brought to a successful conclusion.



The Speaker of the House of Commons (the Right Hon. J. H. Whitley, M.P.) in introducing the lecturer, appealed to any person in the audience who found himself financially in a position to do so, to come forward and provide the funds necessary for the publication of the valuable records which have been amassed during the repairs of the Hall and through the investigations into its structure and history which have been carried on concurrently with them. Government departments, he said, were in too penurious a condition to spend public funds for this purpose though the extraordinary interest of the subject would be made apparent in the course of the lecture.

The history of the Hall was introduced by the lecturer in a novel fashion. On his mentioning the Norman masonry remaining in the side walls of the building from the time of its original construction by William Rufus, in 1097–1099, some electric lamps were made to throw a flood of light upon examples of Norman columns, capitals and arches to which access doors had been provided in the otherwise uniform stone-sheeted surface of the walls. These veritable fragments of eleventh-century work gave very great additional interest to the illustrations thrown upon the screen of drawings compiled from them to show the beautiful arcades which decorated the walls and t passages which provided for access alon entire length in the Norman period. arcades, or rather the portions of them still exist in a shattered condition behind the stone veneer which, since th of Richard II, has been applied to the faces of the walls, were brought to lig investigated during the course of the r Their presence in the walls, unbonded surrounding work, with large cavities the principal supports of the roof, ra difficult problem, since the pressures on t walls were great and the total weight of t steel trusses was expected to amount t three hundred and thirty tons. A plan Hall, showing the positions of the N fragments in relation to one another the later work of Richard II, indicat haphazard methods of setting out com adequate in the Red King's palace. details in the arcades in the two opposit of the Hall are by no means opposite another, and it is quite possible that th timbers of the Norman roof were ar slantwise across the Hall. (See an arti Mr. William Harvey in our issue of J 5, 1923.)

The great width of 69 ft. was not roo the Normans without intermediate su and a view showing the conjectured appe of the Hall in Norman times exhibited l heavy posts rising from the floor and d the span into three portions of mans dimensions. The size of the Hall is rema since it is approximately 240 ft. long and high to the apex. William Rufus, reply the criticism of his courtiers that the b was too large, is reported to have said was but a bed-chamber compared wit Hall he proposed to build for himself.

As is so frequently the case with archit works, great size is not always recogn and the bare side walls of the Hall with dull linings of Huddlestone stone dwa gigantic timbers above. The grandeur building shone out, however, when at int throughout the lecture the upper light extinguished and the warm tawny col the giant beams was made to glow in r light directed upwards from lamps suppo positions near the floor.

Turning to the works of repair (almost building, since the Norman walls were lessly cut to pieces) instituted by King R II, the lecturer explained that, despite a p tradition that the roof was construct chestnut wood, it is really composed, records show, of English oak obtained fro King's Park of Odiham, the Abbot of St. A Wood at Bernan, and a wood by Kingst Thames. The rich warm colour of the su is due to a harmless fungoid growth whic not penetrate to the interior of the wood. pattern of this unique structure was due King's master carpenter, Hugh Herland seems to have been about seventy years the time he produced this astounding d Gothic masons produced their masterpie

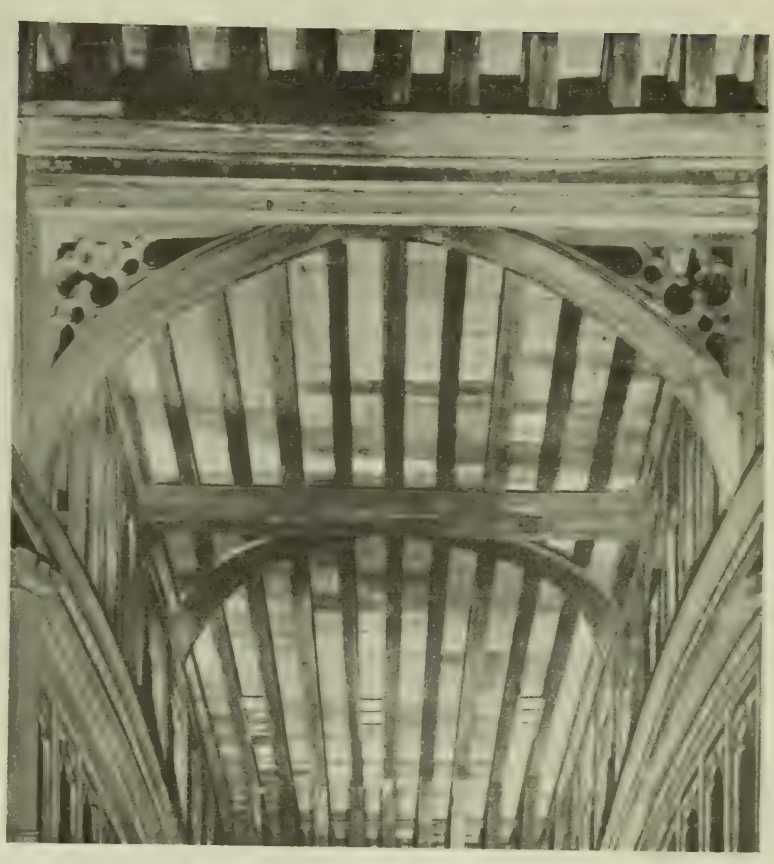
lt of a process of trial and error extending out centuries, but there was no evidence milar roof of anything like the same ns having existed to guide this original who must have created his new work in nce with the foreseeing spirit of scientific ion.

ssurance in daring to place great oak weighing from three to four tons apiece, in the air, was wonderful, and the sup- of each mighty hammer post upon the an angel apparently flying freely in was a stroke of pleasantry of which we ot sufficiently admire the wit.

rief analysis of the functions of the which was practicable in a limited time re a general audience was in substantial nt with an account published in our f June 22, 1923, where the nature of erland's building science, his construc- ius, and his audacious humour, have been set forth.



ecay and repair of the timber roof was ed by a series of lantern slides, in e life history of the Death Watch beetle e almost unbelievable extent of its were made apparent. One difficulty ced the conservator was the inability uthorities to recognise the dangerous of the decay. The plain facts were as alarmist rumours, and the roof ced by otherwise sober and truthful to be quite reasonably sound. The e of opinion was sincere, but optimists wed themselves to be deceived by the appearance of soundness in the outer the timbers which had been preserved ly intact owing to the peculiar habit history of the beetle about which little wn at that time. The larva, or wood- urrows for a period of something like ars in the interior of the wood before its one flight hole on the surface. Even e flight hole is often in an obscure and ble part of the roof, so that there is ly nothing to show for its three years erous activity.

r repairs to the roof had very seldom icient, though some stout baulks had ded to the purlins at an early period l to them with curious slotted bolts with aped keys and washers instead of reads and nuts. As time progressed, the rew more futile and burdensome, and rer was able to point out that the roof as as free from obtrusive patches and s it had been at any time for the last dred and fifty years.

esent method of upholding the decaying was selected with a view to retaining as ossible all the genuine ancient work. een objected that the use of steelwork propriate to the sentiment and to the principles of construction, but without f steel 90 per cent. of the old worm-

Label Moulding of Window in West Bay, South Side.

One of the Bays after Repair, and after Steel Reinforcement had been fixed.

eaten timbers would have had to be replaced. By means of the new steel trusses, 90 per cent. of the old woodwork had been preserved. A possible alternative method of repair would have been to insert patches of new wood as and where required and to strap and bolt them together with steel fish-plates. It was well that this fragmentary method was not adopted, since the decay proved to be far worse than had been anticipated, and the strength of the resulting patchwork would have been problematical. Proof of the necessity for a complete steel truss to each old principal of oak was supplied by the breaking of one of the corbels supporting a wall post of the fifth truss from the north end of the Hall. The old patched and disjointed timbers had reached a stage of decay when movements took place which threw all the weight of the wall post on to the free end of the corbel and fractured the mass of solid stone by the excessive pressure and leverage.

An interesting feature of the lecture was provided by the exhibition of a specially prepared cinematograph film explanatory of the construction of the roof. The jointing and assembling of the timbers was demonstrated in a very convincing manner by means of a moving picture showing the various members of a carefully prepared model being placed in position in relation to one another. This idea is excellent and the present film might be improved upon by having the timbers of the model assembled in the order that must have been followed in the construction of the roof itself. A remarkable series of moving pictures of the larvæ of the Death Watch beetle at work gnawing and tunnelling into the oak and of the adult beetle walking upon the surface was also shown. Decay in the various joints of the structure was made comprehensible in a similar way.

The film ended with a view of Their Majesties the King and Queen at the reopening of the Hall to the public after the completion of the repairs.

THE LEICESTER GALLERIES.

There is so much to be seen in the galleries just now that it is not easy for the picture-goer to fit his time to the best advantage. The beautiful decorative drawings by George Sherringham, at the Leicester Galleries, should not be missed, for they represent something of the best we can find to-day in small decorative pictures. The artist has in most cases made his frames a valuable integral part of the effect. Many charming colour harmonies and elaborate dainty drawings are to be found here, and yet when Mr. Sherringham gives us a simple decorative transcript of landscape in ochre and black he is also wonderfully successful.

THE LONDON SOCIETY.

HAMPTON COURT PALACE.

At a meeting of the London Society held on the 9th inst., in the lecture hall at 18, John-street, Adelphi, Sir Frank Baines, C.V.O., C.B.E., addressed a large and interested audience on the subject of Hampton Court Palace, where the Great Hall of King Henry VIII is now being repaired under his direction. The speaker did not, however, deal with these specific repairs, but traced the history of the palace in a critical and descriptive account which enabled his hearers to form some idea of the characteristics of works of different periods in the building.

Calling attention to the fact that the Tudor palace at Hampton Court, as built by Cardinal Wolsey and enlarged by King Henry VIII, was one of the last great architectural works carried out under the guild system of the Middle Ages, the lecturer illustrated, by means of excellent plans and views, the artistic freedom resulting from the direct employment of masters in the various crafts to design themselves the work they were about to carry out. Such references to the guild system were received with applause by the audience, and whatever uncertainty may exist as to the exact conditions of the building trade in King Henry VIII's time the remaining work of the period undoubtedly exercises a great charm upon the present-day public, including both those members of it who are specially trained in the appreciation of the arts and those who are guided by their own good pleasure as sightseers. The extraordinary carved pendants of the oak roof to the great hall were rightly held up as examples of freedom in craftsmanship. Their exuberant detail implies corresponding enthusiasm on the part of the carpenter artist, who seems to have both designed and carved them.

These are not isolated or exceptional instances, but take their places in a scheme where construction and ornament, planning and execution, all embody a similar spirit.

Craftsmanship had outgrown the fetters which had bound it to the expression of rigid constructional truth during the Gothic period, and from this point of view decadence must be admitted. Comparing the elaborate roof of the hall at Hampton Court with the much larger and much simpler roof erected at Westminster Hall in 1394–99, where every timber, including the ornamental tracery, performs a structural function, Sir Frank confessed that the Tudor roof was not so fine as the Gothic. But, though fancy had been allowed to run riot, the lavish decorative detail in carving and gesso covered with gilding and bright applied colour was magnificent in its own way. And that way was the way of freedom, since obedience to the rigid rules of columnar architecture which were to be imported from Italy at a slightly later date had not yet been enforced.

Just how far the master craftsmen were the designers and how far the general scheme was directed by the Cardinal or King we are never likely to know, though it is probably safe to assume that the freedom of the craftsman from the necessity of following the design of an architect could only be attained in an age when the building owner himself knew much more about the building art than do most intending building owners at the present day.

The records show that the Cardinal and the King supplied the materials necessary for the work, and this fact alone bound them to a much more intimate knowledge and interest in the design than the interest of receiving the building upon its completion.

The names of the craftsmen recorded in the accounts are nearly all English, for although the Italians Giovanni da Majano and Benedetto da Rorezgano were brought over by Wolsey in 1521 they were chiefly employed upon ornamental works, such as the terra-cotta roundels and busts of the Roman Emperors which decorate some of the exterior wall faces.

These evidences of the foreign artist are all applied works and do not form an integral part of the structure, differing in this respect from the greater part of the native work where the divorce of structure and ornament, although imminent, was not yet complete. Sound architectural design in which construction and artistry were inextricably blended together is in evidence in the Tudor kitchen with its immense fireplaces and their fine brick chimneys. Remarking upon the beauty of the orderly diminution of the flues from the great arched openings to more moderate dimensions at their upper extremities, the lecturer pointed out that their design consists in the adjustment of material to meet a practical problem rather than the composition of elevations upon a drawing board. The intervention of paper plans and the professional architect who produced them was, he said, by no means an unmixed blessing.

The beginnings of the pernicious modern system of employing rough construction hidden beneath a more finely wrought visible shell of ornamental features was to be seen in the Palace Chapel, where an elaborate wooden vault of great beauty, if considered as modelled form or painted decoration, was really nothing more than a suspended ceiling below the supporting timbers of the roof.

It is possible, said the lecturer, that the designer of this fan tracery in wood may have been Clement, the master carpenter, who designed and executed the roof of the Great Hall, and it is evident that he was familiar with the somewhat similar stone vault of the Choir of Christ Church, Oxford.

The constructional propriety of the delicate stone vault placed upon the old piers of the Church with full knowledge of the statical problems involved is, however, entirely absent from the timber counterfeit at the Palace Chapel.

The Renaissance style substituting the rigid rule of adherence to the Classic orders, with their pretence of structural interest in place of the appeal of genuine necessary construction, soon followed upon the period of freedom and imposed a formality none the less exacting in that it was artificial and only interpreted the natural laws of building science through the foreign tongues of ancient Greece and Rome

The works designed by Sir Christopher Wren, forming part of the remodelling of the palace inaugurated by the magnificent taste of William and Mary about 1689, fortunately escape from the harshest rigours of the revived classic rule. Sir Christopher Wren as a designer invariably showed himself to be a man of infinite common sense as well as a scientist and antiquarian, and his work at Hampton Court can fairly criticised as an attempt to imit glories of Versailles upon a somewhat scale, whatever may have been the in of the architect's royal patron.

University College, Bangor.

Mr. Alan E. Munby, M.A., F.R.I.B.A., is the architect for the new Science Buildings—Agriculture and Administration Departments—University College of North Wales, at Bangor. The cost is estimated at £66,800. The front will be faced with Portland stone. Internal walls and partitions will be of sand-lime bricks, and considerable use will be made of asbestos-cement pipes for drains. The heating will be by low-pressure accelerated hot water. The total floor space will be about 60,000 sq. ft. The foundation stone was recently laid by the Prince of Wales.

223, Regent-street, W.

This building has been erected by "Isobel," the well-known dressmaker, by whose courtesy these photographs are reproduced. This structure forms part of the general Regent-street reconstruction. The contrast between the black marble base and the Portland stone superstructure is very striking.

The whole of the shop front has been designed with considerable restraint and the silver-bronze shop frames and entrance gates create the atmosphere so essential to this class of business. The interior decorative scheme makes an excellent setting for the gowns for which the House is noted. Black marble and silver-bronze have been extensively used inside, and the staircase is of black marble.

The general contractors were Messrs. Somerville & Co., Ltd. Sub-contractors: Steelwork, Messrs. The Somerville-Barnard Construction Co.; Portland stone, Messrs. F. J. Barnes, Ltd.; metal casements, Messrs. W. James & Co.; silver-bronze gates, balustrading and grilles, Messrs. Wm. Morris & Co., Ltd.; black marble, Messrs. Jenkins & Sons, Torquay; decorative plaster work, Messrs. Martyn & Co., Cheltenham; parquet and wood block floors, Messrs. Hollis Bros.; shop fronts, Messrs. F. Sage & Co., Ltd.; fitting rooms and enclosure, Mr. P. Turpin; heating, Messrs. Mumford, Bailey & Preston; electric light, Messrs. Mann, Egerton & Co., Ltd.; furniture and hangings, Messrs. Maple & Co., Ltd. The architects are Messrs. Yates, Cook & Darbyshire, Great Marlborough-street, W.

Colour Competition.

We give this week, in colour, the first premiated design in the competition organised by Messrs. Thos. Parsons & Sons, Ltd., for colour schemes for the decoration of the vestibule of their premises in Oxford-street, by Mr. E. A. Cox. We reviewed the designs last week.

New Premises for the Holt Line, Liverpool.

In this issue we give three illustrations of the design sent in by Messrs. Willink & Dod in the recent competition for Messrs. Alfred Holt & Co.'s office building, Liverpool.

The design placed first, by Mr. Arnold Thorneley, F.R.I.B.A., and Mr. H. J. Rowse, A.R.I.B.A., was given in our issue for October 12.

MEETINGS.

MONDAY, *November* 19.

Royal Institute of British Architects.—Mr. G. Topham Forrest on "The Rebuilding of Ypres." At 1, Wimpole-street, S.W.1. 8 p.m.

Royal Academy.—Professor A. P. Laurie on "Methods of Wall Painting." 4 p.m.

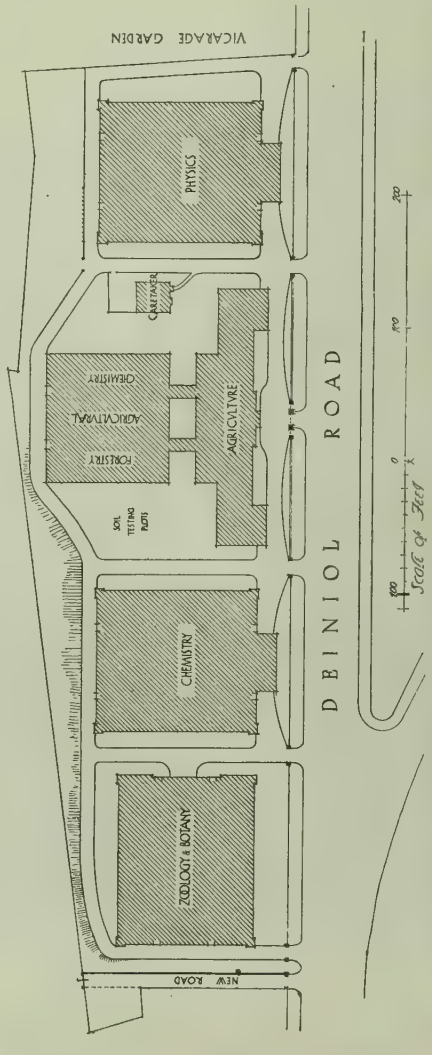
TUESDAY, *November* 20.

Royal Academy.—Professor A. P. Laurie on "The Theory of Colour and its Application to Painting." At Burlington House, W. 4 p.m.

WEDNESDAY, *November* 21.

Reading Society of Architects.—Mr. H. C. Corlette on "The Mediæval Point of View." At University College, Reading. 8 p.m.

Royal Society of Arts.—Mr. J. A. Knowles on "Forgeries in Ancient Stained Glass." At John-street, Adelphi. 8 p.m.



L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Origins and Evolution of the Doric Order." 6 p.m.

Royal Academy.—Professor A. P. Laurie on "Building Materials made of Waste Materials." At Burlington House, W. 4 p.m.

THURSDAY, *November* 22.

Builders' Benevolent Institution.—Annual Dinner. At Hotel Victoria, W.C. 7 p.m.

CONCERNING COMPETITIONS.

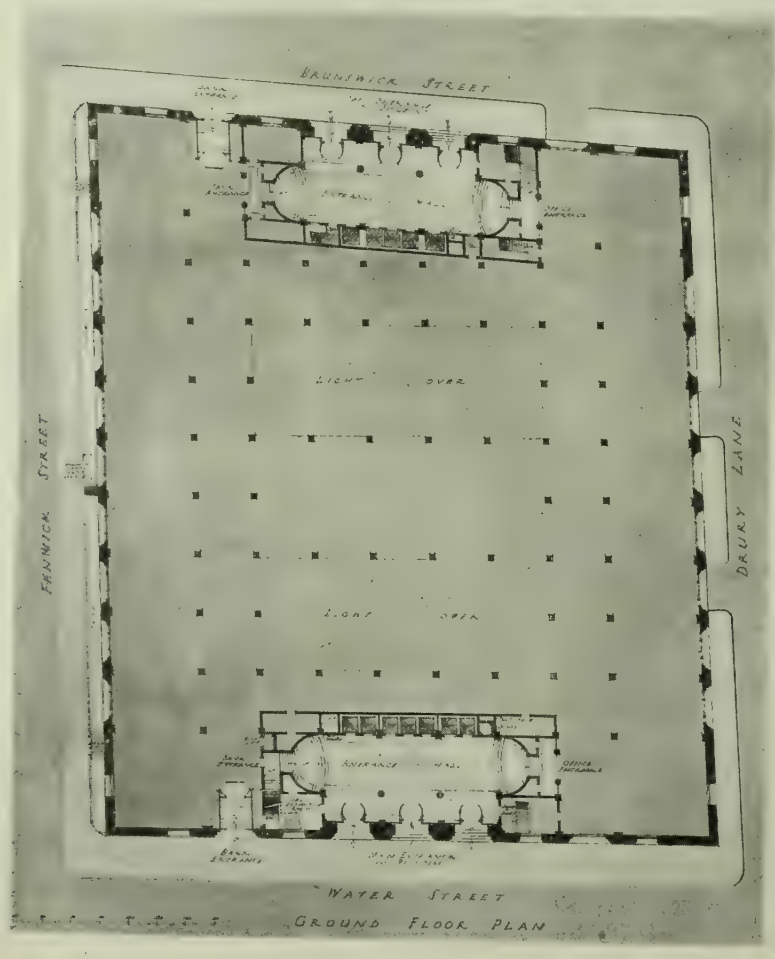
MR. HORACE R. APPELBEE writes:—

SIR,—With regard to the question of single assessor *v.* jury, on which I ventured to express some views in a paper at Birmingham many years ago, there is a point which seems to me to be of great importance and yet in danger of being overlooked. To obtain a satisfactory award it is not a question of numbers, but of qualifications of the judge or jury, and it is largely because all qualifications are not combined in one man that more than one becomes necessary. The difficulty is that we have no agreed standard by which to judge the merits of a building either on paper or in reality, and there are three very distinct points of view. Let us call them "A," "B," "C." All architects come under one or the other.

When there are many competitors there will be some of each class. A single assessor is of only one class. It is inevitable that the designs submitted by those of his class will appeal to him, and the other two will not. For exactly the same reason these two classes will fail to appreciate his award. If instead of a single assessor we have a jury everything depends on its constitution. Three men of the "A" class will arrive at very much the same result as a single assessor of the "A" class. The jury should look at the matter from all points of view, and therefore consist of "A," "B," and "C" men, but could it then agree on a verdict? It is an interesting point.

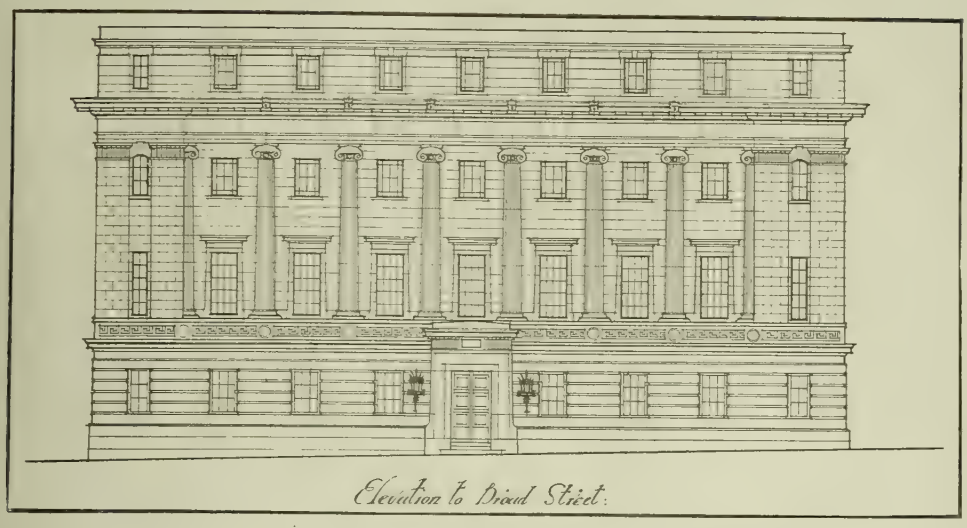
During the past fifty years probably no architect has had a greater reputation as an artist than Norman Shaw, but we instantly associate his memory with houses great and small and some churches. Like others, he had his limitations; what, for instance, did he know of lunatic asylums or public baths and washhouses? He is typical of class "A." Asylums and public baths have often been the subject of competitions. Usually they are among the ugliest buildings in the land. Their planners are of a very different type from Shaw; they are without his artistic ability, but they possess a knowledge of requirements, of sanitation, of special engineering, of organisation, and of the working relation of one part to another in which Shaw was lacking. These are typical of class "B."

Which is the standpoint from which the merits of these buildings should be judged? The practical and financial side (running cost, not the original building cost) or the æsthetic side, or is there a better way than either? The third type, "C," that I had in mind considers that no project is good which loses a single practical point of importance in an endeavour to produce a fine æsthetic effect, and at the same time does not see why a really practical building should suffer in artistic effect.



It is difficult to extend this argument as I should like without references to contemporary work, which are undesirable, but I may perhaps be permitted to refer to something which happened twenty years ago.

Chelsea Borough Council desired a public baths, and they stated that they were "anxious to secure a building which shall not only be adapted to their requirements internally, but shall also possess distinct architectural merit externally with as little detail as possible." They appointed Mr. Norman Shaw, R.A., "to act for them their assessor and adviser," with the re that he, in effect, bracketed two for place—that is, he thought No. 45 the plan, but since the Committee asked architectural merit he put No. 21 first best satisfying that requirement. An satisfactory award, of course. A descrip of these plans appears in *A.A. Notes* April, 1902. "Mr. Shaw's model plan of course, the centre of attraction. . . . and women enter on either side of the ti and superintendent's offices; the men for f class private baths pass by the wom waiting-room to obtain their tickets. The for these baths is 40 ft. square and 12 ft. high, with daylight on one side o True 'light over' [perhaps a clerical e for 'ventilation over'] was written near opposite wall, but it was at the bottom o well 5 ft. wide and 14 ft. high. As this is divided up into cubicles with partitions 6 high or so, the place will have to dep largely on artificial light during dayli hours. The first-class swimming bath easily reached, and is well arranged entertainments. We pass a door and en the second-class department—swimming private. The private baths occupy a space the first floor about 112 ft. by 40 ft., with flat ceiling over about one-half the area span roof over another portion, and a lean over the rest—all irregularly set out. Is t planning? On the women's side an 8 corridor at right angles to the front leads the staircase to their second-class bat No. 1 branch to the right leads to the fi class private baths. To reach the swimm baths you must take the second turning to right and the first to the left.



"A most important point in bath plann is the dealing with clean and dirty towels bathing dresses. Usually these are given t bather on taking his ticket, to be left by l in his dressing box or room; thence they h to be conveyed to the laundry, and, a washing, to the store or ticket office. . . . our 'best' scheme the basement is full subways for access to pipes, etc. Shoots arranged anywhere from the baths to the s ways for the dirty linen, for the collection which artificial light must be mostly us To reach the laundry, which is on the grou floor at the back of the site, a lift is provid but it is 60 ft. away from the washhou . . . The boilers are placed amidst a regu crop of columns, and it will be a puzzle get them in or out. The boiler shaft against the boundary of the site, so that foundations will underpin the Town H buildings. As to the elevation, it can readily understood that it did not appeal Mr. Shaw.

"No. 21 is a very artistic and business-l design. The approaches are all direct well lighted. . . . There are no small li shafts on the first floor, light and air ground floor being obtained by a small cou yard in the centre of the front near the stre the first floor being carried across the entra to it on columns. There is a short subw in basement—not daylighted—for tow shoots, with lift direct to laundry. The ele tion is distinctly that of a public buildi with good detail, vastly superior to the des selected by the Committee—or Mr. Shaw. is hard to see where the plan is inferior practical points, and otherwise they cannot compared for a moment."

It appears to me that Shaw approved elevation, general lay-out, and detail (arc tectural) of No. 21, but failed to appreci its excellence on practical points with wh he was not familiar, and some strange in ence was at work to persuade him of advantages of No. 45, which he left Committee little option but to accept. If eminent architect, experienced in baths' wo had been associated with him, the res would probably have been a strong, defin pronouncement in favour of No. 21 on points.

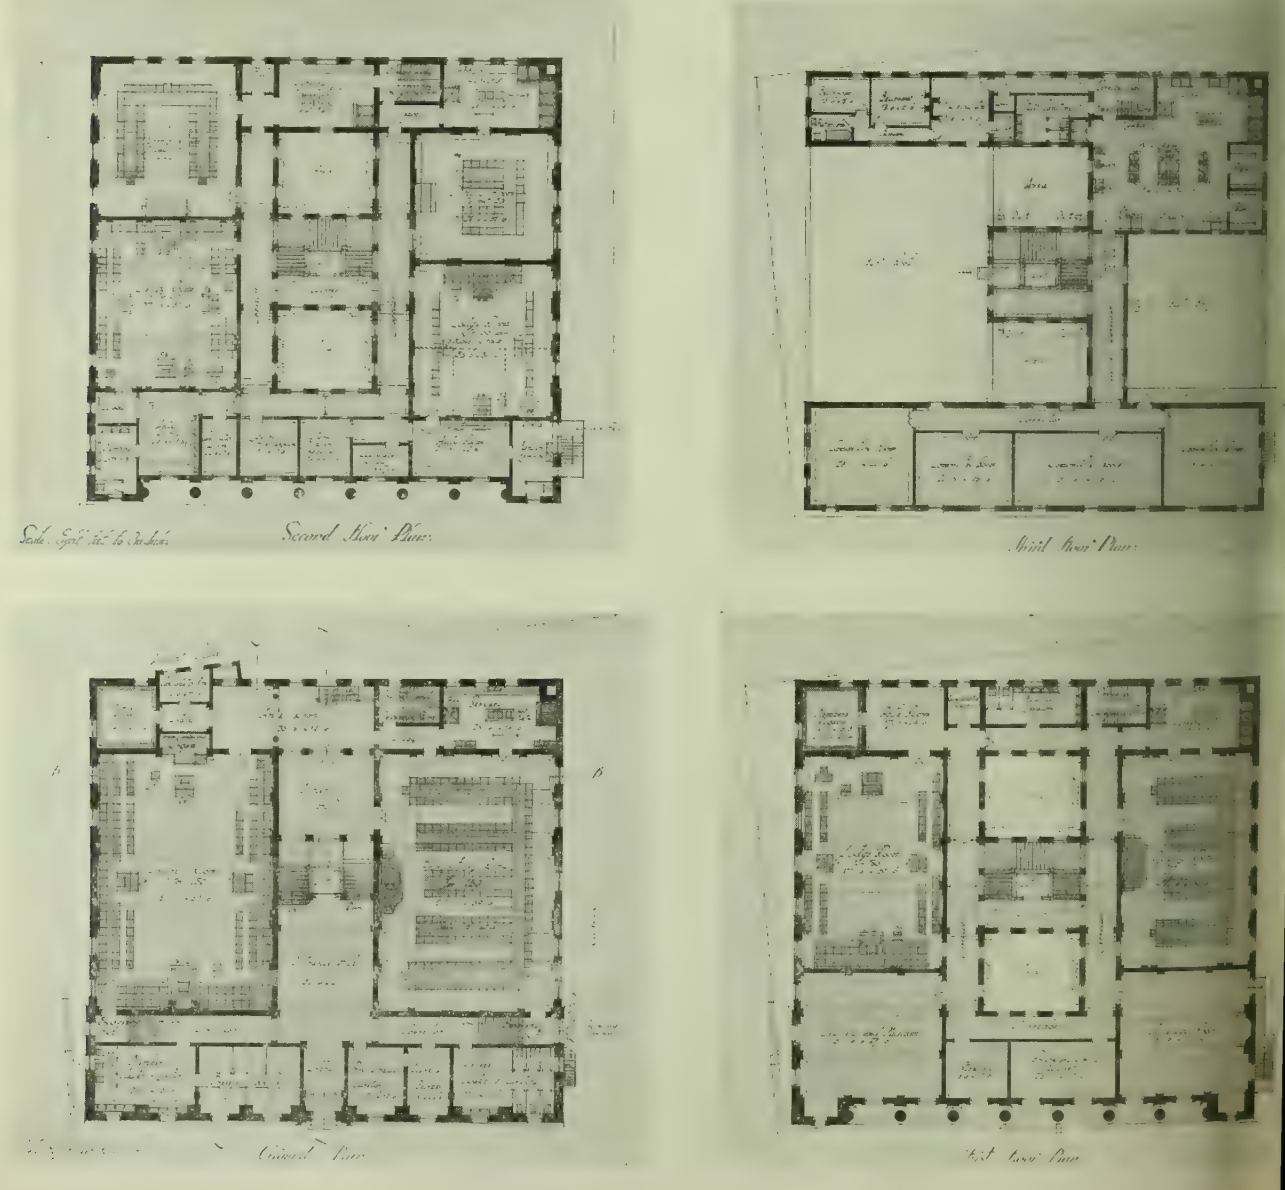
TOWN PLANNING.

III.—MEDIÆVAL CITIES.

FOLLOWING is a summary of the third of the series of lectures on Town Planning given by Mr. Wm. Haywood, F.R.I.B.A., at Birmingham University.

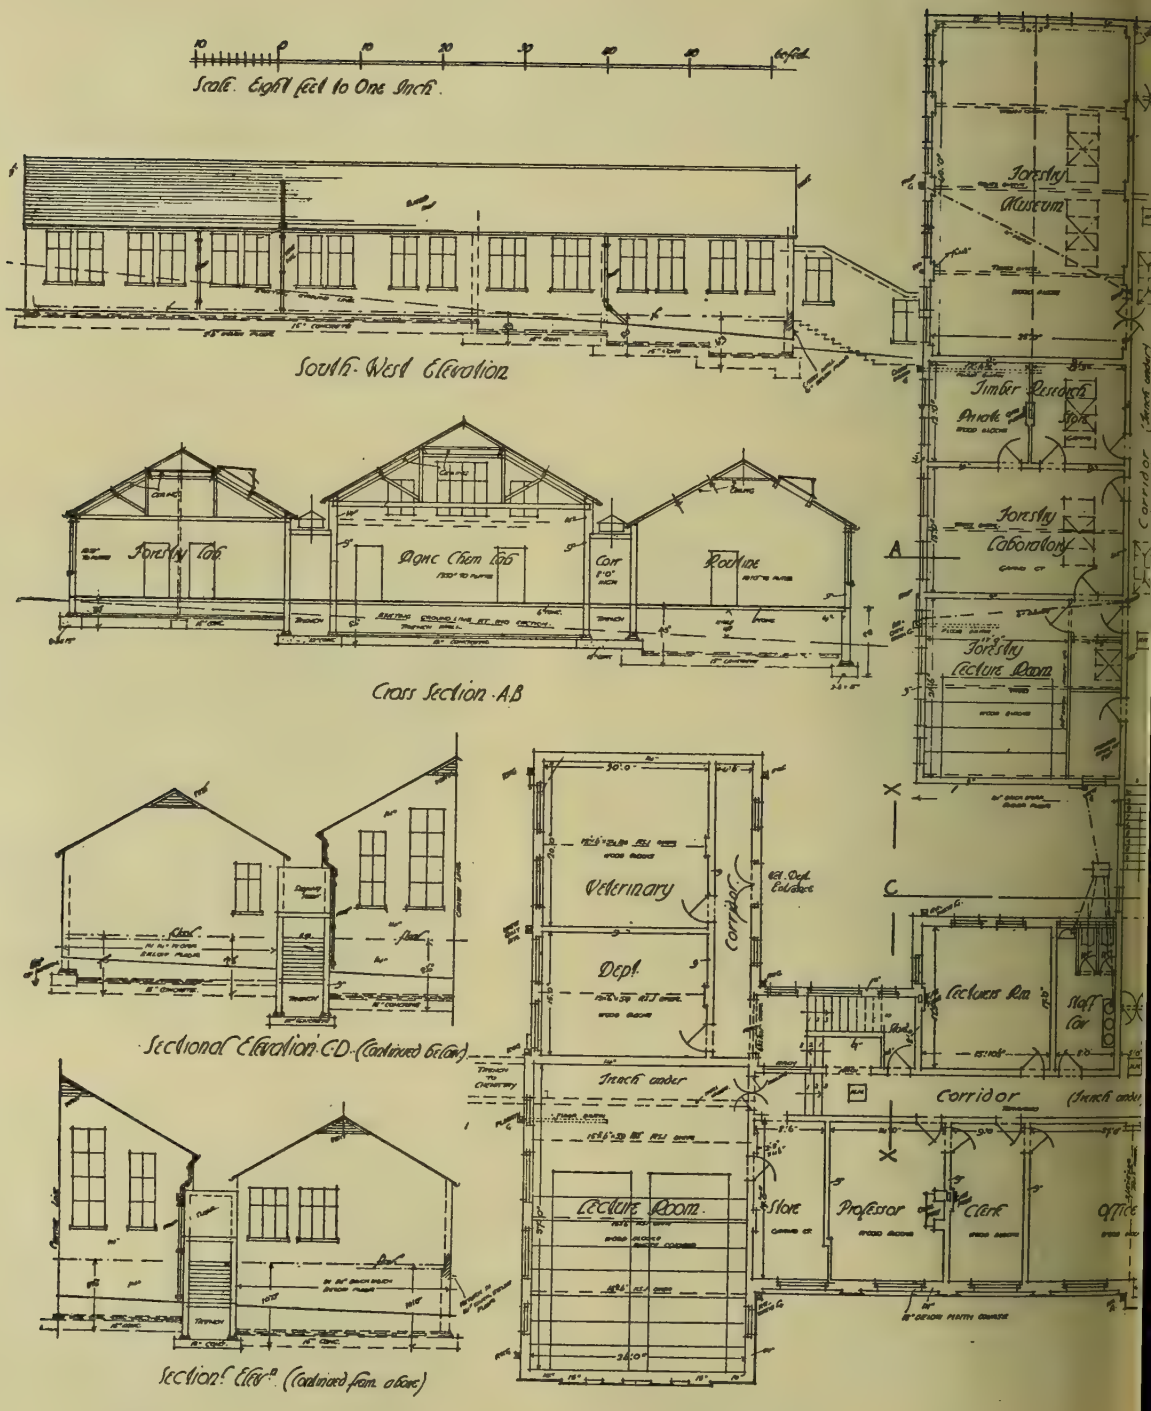
There is a general impression—derived largely from historical novels—that mediæval cities were always romantically irregular; but this impression is far from being correct. In the great town-planning period of the thirteenth century many cities were built, the military and political character of which called for virgin sites, and for wholesale building at short notice. Towns built under these conditions are invariably regular in plan, and the simple chequer-board arrangement—varieties of which are found in all ages and places—is obviously the first thought towards orderly planning when there is occasion to build a complete city.

Many such towns were built in Provence after the Albigensian Wars, with the object of consolidating military success by a policy of peaceful penetration. Many also were built in France, England and Wales by Edward I; examples being Montpazier, Hull, Conway and old Winchelsea. Salisbury had a peaceful origin, and perhaps for that reason achieved some improvement in the monotonous effects resulting from the ordinary gridiron arrangement. In A.D. 1220 the old city on the hill was abandoned for a new city in the plain—two miles to the south—which had been built by Bishop la Poer for the greater convenience of the inhabitants; and the wide streets of this town—each with a central stream of water—were much admired by Leland, who visited the city in the sixteenth century.



It must not be inferred from the emphasis placed upon formalism in books which treat of ancient town plans, that this quality is desirable, and that irregularity is to be avoided. Both qualities have their use, and in those towns which grow slowly out of local conditions, where irregularities had been found convenient by experience or were compelled by local topography, the mediæval designer built informal settings to enhance the effect of existing buildings, the æsthetic value of which has only recently been fully appreciated.

That such settings were carefully designed and not haphazard is shown by what happened at Ulm, where—the Cathedral precincts having been cleared of nearby buildings, which were thought to obstruct the full play of its beauties—they were found to have so enhanced its effect that equivalent buildings were planned at once to re-establish the old conditions. The utility of designed irregularity is best seen in the mediæval arrangement of churches in narrow streets; where the building is recessed from the line of traffic to give roominess for oc crowds, and at the same time to provid ground suitable to a building of s importance.



BIRMINGHAM MASC TEMPLE COMPETIT

THE second premium in the recen petition for a Masonic Temple in Birm was awarded to Mr. S. N. Cooke, F.R whose design we illustrate this week motive of the plan is the disposition lodge rooms. These have been plan ensure the utmost quietness, being kep from both the front and the back walls building. Every lodge room is *en sui* its own dining room, and every dining has a service room connected with lifts kitchens, which are placed at the top building, it being considered that ba kitchens are always a nuisance. The lo the site have also been utilised, the larg room and dining room being approache the lower level.

The first premiated design, by Mr. Savage, F.R.I.B.A., was given in our i September 28.

ADING SOCIETY OF ARCHITECTS.

"The Roman Point of View."

second of a course of four lectures on ecture, arranged by the Reading Society chitects in conjunction with the Reading of the Workers' Educational Association. ven in the large hall at University College, ng, on Wednesday last week, when the chair aken by Mr. Edward P. Warren, F.S.A., B.A., the President of the Berks, Bucks, xon Architectural Association. Some ersons were present. The lecture, which n "The Roman Point of View," was ated by numerous lantern slides.

lecturer, Mr. Paul Waterhouse, opened scourse by disclaiming any intention of g that the Roman people would have rledged a point of view at all. Probably, he best art was spontaneous, they had no ousness of a policy in architecture as a National views on architecture were. very different affairs from the traditions crets within the craft itself.

ing aside as erroneous the notion that omans were mere blind copiers of the and artless appropriators of the achieve- of other and earlier nations, he proceeded aid of slides to develop his opinions on nd of architectural cause and effect in ater periods of Roman supremacy. The ons and problems of Rome had, he said, extraordinary parallel in the circum- of modern England. There was hardly em of our own, however baffling, to which ld not apply the test "What would have done," and very few to which did not supply either an answer or a ion.

Roman position, as regard anterior cture wherever found, was not that it oreign stuff to be borrowed," but that, eing mistress of European civilisation, it ome's. Further, the employment of r forms, developed or undeveloped, was age but merely the carrying out of that of leaning on the past, which was the ceptable method of architecture in any great periods.

OME SCHOLARSHIP ARCHITECTURE, 1924.

Faculty of Architecture of the British at Rome has granted permission to the g to take part in the preliminary com- for the Rome Scholarship and Henry Studentship in Architecture of 1924.

D.I.C. HOUSE COMPETITION.

THE site purchased by the D.I.C. House (Cross-street), Ltd., on which it is proposed to erect a building to be known as "D.I.C. House," is situate next to the south-western corner of the Exchange with its front facing Cross-street and its back Half Moon-street, Manchester. The superficial area of the site is about 447 sq. yds. When the new building is erected the front will not extend into Cross-street as far as the present frontage, but will continue the building line of the Royal Exchange, thus relieving a busy corner of much of its traffic pressure. In order to ensure having a new building which, whilst utilising the available space to the best advantage, will be a credit to the city architecturally, the Directors of the Company invited a number of architects to submit plans for the building. Professor C. H. Reilly, O.B.E., M.A., F.R.I.B.A., acted as assessor

The following are extracts from the conditions of the competition:—

"The promoters desire to obtain a building of the greatest possible dignity consistent with the requirements. For this purpose they suggest that the building should be designed both externally and internally in as broad and simple a manner as possible. The building must be constructed of fire-resisting materials throughout, inclusive of floors, roofs and staircases. The drawings must be accompanied by a concise typewritten description of the building, its construction, finish and materials proposed to be used, and giving such information as cannot clearly be shown on the drawings. An estimate of the cost must be attached to the statement based on the total cubic contents of the building including foundations, roof and chimneys. These cubic contents must be given. The total estimate should include for decoration, heating, ventilation, electric light and power, gas, lifts, and all permanent fixtures. A schedule of lettable floor space should be added. Any design adjudged by the assessor to be likely to materially exceed the sum of £42,000 on the building and fittings, as described in the above condition, will be disqualified. The building is to occupy the inner area up to the improved frontage line, the splayed corner being carried up to the full height of the building. The drawings required are:—(1) Plans of the ground floor, the top floor and a typical floor showing how they may be divided for letting purposes, one section and the elevations to Half Moon-street and the Public Passage all to the scale of $\frac{1}{8}$ in. to 1 ft. (2) Elevation to Cross-street to the scale of $\frac{1}{4}$ in. to 1 ft. (3) A perspective view from the opposite side of Cross-street showing the Cross-street front and the splayed corner to the Public Passage on a sheet of paper not greater than Imperial size. All drawings to be rendered in monochrome and mounted on cards.

"*Accommodation Required.*—The building is to be first for ordinary office purposes. The ground floor should be designed for shops with separate entrances for the offices above. The office story immediately above the shops and the basement below should be designed to be let with the shops. Below this basement may be another over a portion of the site for the heating apparatus. The building should be designed for a ground floor story of 15 ft. floor to floor and seven stories of 11 ft. each, making a height of 92 ft. in all. It may be assumed for the purposes of the competition that the promoters have come to arrangements with adjacent owners on questions of light and air. A small flat for the caretaker should be provided as part of the top story."

Thirteen sets of drawings were submitted, and the assessor selected those sent in by Messrs. J. G. Prestwich & Sons, of Manchester and Leigh (illustrated in our last issue), and highly commended the plans by Mr. H. S. Fairhurst, of Manchester, and those jointly designed by Mr. G. H. Willoughby, of Manchester and Blackpool, and Messrs. Rees & Holt, of Liverpool.

When the new building is finished it will be seen as a very simple version of an Italian Renaissance palace design; a straightforward building of Portland stone with plain granite piers on the ground floor. This is literally in accordance with the condition of entry to the competition mentioned above. The whole of the thirteen sets of plans submitted will shortly be exhibited at the Manchester Art Gallery, together with the designs submitted for the Masonic Temple to be built in Bridge-street, Manchester.

It is expected that demolition of the present building will commence shortly, and it is hoped that the new building will be commenced in the early part of the new year.

Professor Reilly, in making his report to Mr. Arnold Williams, the Chairman of the D.I.C. House (Cross-street), Ltd., added the following:—"Finally, I congratulate you on the excellent result of your public-spirited action in holding this competition through which you have obtained a very workmanlike and satisfactory design."

THE OLDEST THRONE IN EUROPE.

IN a lecture on Wednesday last week at the Central School of Arts and Crafts, dealing with the early period of Greek architecture and its remains, Sir Banister Fletcher described the primitive walls of the oldest cities of Greece, called "Cyclopean," from the gigantic blocks of which they are composed. This early work contrasts strangely with the refined and delicate work of the temples erected centuries after, evolved from it by the constructive and artistic spirit of the Greeks. The lecturer described the citadel of "wall-girt" Tiryns, looking out over the sea; the celebrated "Gate of Lions" at Mycenæ, another stronghold, looking over the Argive plain; and the walls of legendary Troy, on the great trade route between East and West.

The remains recently discovered in Crete formed his principal theme. Egypt, Babylonia, and Greece have in turn told us their story of ancient civilisations; but Crete kept her secret until Sir Arthur Evans revealed the site of Minoan civilisation and the birthplace of European architecture by his excavations at Knossos—a story which the lecturer told anew, by the valuable aid of graphic lantern views. The legends of the Minotaur and the labyrinth have been surprisingly objectified in these discoveries, and the plan of the palace is labyrinthine indeed. Views were shown of the throne room, with its world-famous stone chair of the great King Minos—"the oldest throne in Europe," said the lecturer—which still stands there to-day as it stood some 4,000 years before our era. Its appearance may be appreciated from the model in the basement of the British Museum. The theatre and Hall of Double Axes, so called from the mysterious emblems inscribed on the piers, were also described, as were the long corridors of tall and graceful oil-jars, the magazines, the staircases, and other features. The palace was equipped with all the equipments of the time, and some seem startlingly modern, such as the socketed drain and water pipes, baths, and corn chests. A grand staircase leads to the queen's suite, designed for comfort, air, and sanitation. There are no traces of fortification on the island, and we know that the strength of Crete, as of Britain, was in her Navy.

The succeeding lectures will deal with the developed or "Hellenic" period of architecture, the Golden Age of Greece, and a study of the conditions of civilisation which helped to mould it, the chief centres where these great buildings were erected, and the characteristics, structural and decorative, of Greek architecture in general.

THE TOWN-PLANNING INSTITUTE.

Presidential Address.

THE opening meeting of the Town-Planning Institute was held on Friday last week at 92, Victoria-street, when MR. T. H. MAWSON delivered his presidential address.

MR. MAWSON first recalled the town-planning conference called by the Royal Institute of British Architects in 1910, and the pronouncement of Professor Beresford Pite that the problems of town planning were architectural and would be ultimately judged as such. In founding their University Schools of Town Planning and in the Constitution of the Institute they had recognised the necessity of bringing to every town-planning scheme the best brains of the country to solve its legal, financial, constructional, and æsthetic problems, and all these contributors were bound together in mutual enterprise and helpfulness within their constitution. Thus they had had as presidents men famous in the realms of municipal law, economics, surveying, engineering, and architecture, and they had now recognised that landscape architecture had its place and use in the evolution of the city towards its finest expression as a place not for toil only, but for the development of that fuller citizenship which demanded opportunities for recreation and cultured leisure for all its sons and daughters. This age, which was struggling after the conscious expression of civility and elegance, could not any longer afford to regard the landscape architect as a mere contributor to the ease and luxuries of the rich. They must recognise that his first moral obligation was to the masses of their fellows who needed that "refreshment of body and spirits" which contact with Nature always engendered, and for the young healthy exercise, with leisured ease for their elders. The expert engineer might join forces with the expert horticulturalist, but this combination would not give the desired results, for the art which he would endeavour to define for them was not primarily engineering, and it was not horticulture. They must have the trained designer with the soul of an artist, expert in constructional details and possessing at the same time an intimate knowledge of those materials, particularly of all growing things, by which he clothed and expressed his ideals.

For reasons which baffled his understanding they had never thought it essential to train up such a body of experts capable of giving expression to these idealistic principles, and he was getting very anxious for the future. Compare for one moment their country with America, where at least two hundred and fifty students were under training in seventeen universities, seven of which provided four-year courses to post-graduates. The only approach to academic recognition of the art of landscape architecture in this country was the course of six lectures which he gave each year to the students in civic design at the Liverpool University. He was convinced that the price they would eventually pay for this terrible neglect of a noble art would be the loss of the prestige which a mere handful of strenuous enthusiasts had sought to maintain.

Having urged the recognition and study of landscape architecture as a contributing factor in the development of the ideal city, they might reasonably ask him for a definition of the art and the sphere within which it might be exercised. This was all the more necessary in view of the fact that what he had so far urged might apply solely to the design of the park and garden units which were located by some other hand. Personally he could not, and never had, accepted any such limitations of its functions.

"Landscape architecture is primarily a fine art, and as such its most important function is to create beauty in the surroundings of human habitations and in the broader natural scenery of the country; but it is also concerned with promoting the comfort, convenience, and health of urban populations, which have scanty access to natural scenery, and urgently need to have their hurrying workaday lives refreshed and calmed by the beautiful and reposeful sights and sounds which Nature, aided by the landscape art, can abundantly provide."

This was the best definition of landscape art he knew. It was from a letter of Professor Charles W. Eliot to the editors of *Landscape Architecture* in October, 1910. It would bear sincere and earnest analysis. It might be thought at first sight that the definition did not give sufficient place to what they called unspoiled natural scenery, but this was the note which ran through it all like the red strand in the ropes of the British Navy. In its more restricted application he had elsewhere described the functions of the art as topographical architecture or as "the art which attempts to secure the agreeable relationship of parts to the whole." This was its main differentiation from architecture as ordinarily understood, which concerned itself mainly with the design of the unit. This did not, however, complete a definition for landscape architecture: it was also the art which sought to harmonise art and nature, and in Bagshot's phraseology "to determine which shall be conductor and which first fiddle." It was also the art which sought to design and adjust the amenities of a town to the needs of its population and to realise the æsthetic possibilities of the site in consonance with physical conditions and residential needs. If they urged that he was merely confusing issues and applying labels, and calling city planning landscape architecture, he would add that finally it was the art which sought to understand and interpret Nature, and to apply its lessons under varying conditions of site and climate.

To accept this broader definition did not lessen their dependence on the sister arts or contributing sciences in the evolution of their town plan, but it did suggest a new attitude of mind towards creative beauty, and especially the beauty of Nature as a definite moral making for civic betterment.

If they accepted the foregoing, the first question which arose was what was the scope within which the art might legitimately and practically be exercised, and under what conditions, applying Bagshot's simile again, might the landscape architect be conductor and the rest be members of the orchestra? He wished to be frankly fair, and to admit the possibility that all town-planning problems might not "ultimately be judged problems of landscape architecture." They might, for instance, eliminate from his particular sphere of operation the scientific development of a factory area or the planning and construction of great docks, the planning of railway goods-yards and abattoirs, but he might reasonably add that it would be difficult to plan a really beautiful civic centre without some reference to this art.

For the purpose of their inquiry they might divide towns and cities under six headings: (1) Manufacturing cities like Bolton; (2) commercial and distributing cities like Manchester and Liverpool; (3) pleasure cities like Blackpool and Scarborough; (4) University cities and cathedral cities like Oxford and Cambridge, Canterbury and York; (5) Governmental centres such as Washington; (6) composite cities like Salonika in Macedonia and Regina in Western Canada. Five of these six types had each a dominating *motif* for its existence, requiring the controlling influence of specialised professions, but all in due proportion needing the skill of the landscape architect. The manufacturing city in the ample provision and proper location of its recreational facilities for adults and playgrounds for its children. The commu city in the provision of its parks and re tional facilities, and also in the provisi those stately town squares and radi boulevards and open spaces, which al seemed to be the natural way of expre commercial opulence. The University required the planning and arrangement o colleges in relation to each other, and provision of quiet courts suggesting lectual oases, along with those ample pl fields in which so much of the charact young England was developed. Also was the provision of those beautiful bo gardens, so delightful in Oxford and bridge, where love of beauty is so gr promoted. In the cathedral city where the landscape architect come in? If compared the ample, restful, unbroken lawns which formed such a splendid se to Salisbury Cathedral with the ragged roundings of, say, Ely, they would even see the opportunities for the landscape a tect. The capital city called most of al a dignified use of Nature's beautifying to here round the great Parliament and de mental buildings they had to create greatest of all centres, the national c which should epitomise all the attainm and hopes of the nation. In the lay-ou the pleasure city it might with some forc stated that the dominant problems were t of landscape architecture. Here beauty utility, and ugliness intolerable. Such a often lived by the preservation of its na amenities. Cut down the pine woods Bournemouth and develop Boscombe Chin a shopping centre, and they would at produce bankruptcy; take Lord-street ou Southport and what had they left? Or away Princes-street-gardens in Edinbu and what became of Princes-street? Des the boulevards of Paris, and it would large measure lose the quality which attra so much of its wealth. He thought would concede at once that the plan pleasure city should be dominated by its menades, its groves and gardens, its p and recreation grounds, woven together a coherent park system, and that the ti circulation in such a city should be mad contribute to the all-pervading note of a adorned by Art and Nature. Everyt should be subservient to one contro factor, namely, the commercial value sylvan beauty.

As examples illustrating the influenc the landscape architect Mr. Mawson proce to deal with Salonika and Regina, and ad also a visit to the cities of Minneapolis St. Paul as evidence of the achievemen landscape architecture in the provision park system.

Discussion.

PROFESSOR BERESFORD PITE, in movin vote of thanks to the President, said subject of the combination of the beautie Nature with the necessities of civic life practically a modern subject. The civil ditions under which they lived in their were as ancient as they could be alth they were constantly changing and ta new forms, but the problem to which Mawson had addressed himself was a bination of art and natural beauty with requirements of purposeful utility, and it this combination which was so important was so difficult. Fundamentally the fina problem had a great deal to answer fo the brutal ugliness of their bigger cities. President had been fortunate in the citie had had to deal with instead of such a blem as that of Manchester, where would not grow. He trusted that cities v out natural amenities would be inspire consider their own problems, which he fe little architectural instinct and a great of architectural consideration might s They would do no good if they pursued subject from the point of view of art ideals only, for they would find themse complicated by practical difficulties.

al modern standpoint was directly d to the idealistic view of things, and ad to keep themselves in sympathy with ric difficulties of these huge manufac- cities. He suggested with regard to ester, which had a large number of himneys, that had they been set out rically those chimneys might have had thetic value without interference with sefulness. The great smoke stacks of elsea Electricity Works had an æsthetic mply because they were geometrically ed. In the same way the great spoil which defiled the Midlands and the might, if treated geometrically, give a ion of the Pyramids. He suggested, re, that there were possibilities in the hical treatment of factories and land- in districts where trees would not y which they could get something like tural effects from the unpleasing evi- f commercial activity. The interest in ject was modern, for it was doubtful if eeks really enjoyed a garden. The n of ancient Athens would have defied wn planner, and much the same was Rome. At the time of the Renaissance, r, there grew up in Southern Italy, s wealth and aristocracy, a love of the garden. From Italy the fashion spread nce and England, but always as the domain of the wealthy proprietor. vas the first city to democratise, so to the joys of the garden for the benefit whole populace. The subject brought ace to face with the smoke evil. The architectural achievements of history ie to tyrannical despotism, and they as titute associated with engineers and ts represented wealth and power. represented forces which could effect reat reforms, and he hoped they seek by wisdom and study and by co-ordination to use that power to the d.

CARBY HALL seconded the motion, and feeling was that town planning to be ul required a combination of the archi- d surveyor, engineer and landscape r.

motion was carried.

PRESIDENT, in reply, said it was his o raise a greater interest in landscape ture, for they wanted more landscape ts.

---

al" of the Town-Planning Institute.

have before us the first number of Volume 10 of this *Journal*, which is notable as a departure from the old form of the Institute's *Journal*. A great deal of criticism was, we understand, directed against the *Journal* in its old form, members complaining that it contained practically nothing but the actual papers read at the meetings. During the current year a sub-committee was appointed by the Institute to consider the possibility of improving it, and it was decided to appoint an honorary editor, which office was finally undertaken by Mr. Reginald Bruce, A.R.I.B.A., and the issue which we are noticing is the result of his work. Both the Institute and their honorary editor are to be congratulated on the advance in usefulness of the *Journal* with this number. It now contains an editorial and notes, a report of the recent Conference at York, nearly two pages of news items of interest to town planners, and various reviews, notices of future events, with comments on Ministry of Health reports, correspondence, etc.

HYGIENE AND ARCHITECTURE.

THE first of a series of Chadwick Public Lectures was given at the Royal Society of Arts, on November 9, by Major Harry Barnes, V.P.R.I.B.A., F.S.I.

The lecturer dealt with the relation between hygiene and architecture, and after quoting a definition of hygiene "as the art of securing a healthy mind in a healthy body," and of architecture "as the index of the mental and moral qualities of a people," proceeded to point out the conclusions which might be derived from these definitions, namely: that in the history of a people their hygienic developments would precede their architectural achievements seemed to be falsified by the facts. There had been two great periods of architectural perfection in European civilisation. The hygiene age, however, was still in the future. In the days (1357) when it was the custom to throw filth and rubbish into the Thames, the genius of Gothic art bloomed to its finest flower. While admitting the attention paid to hygiene in Hellenistic and Latin cities, there was nothing to support the thesis that architecture was the aftermath of hygiene. On the contrary, while architecture achieved its crowning glories when sanitary science was almost unknown, the battle of public health was won when architecture was at its lowest ebb.

The lecturer then proceeded to show that the conditions that gave hygiene its problems and architecture its chances were the conditions which arose from urbanisation. The perception of the fact that architecture was more than the aggregation of precious materials, enriched by craftsmanship, led to the science of town planning, and this science represented the unified conception of the things which were for the health and happiness of a community.

In conclusion, the lecturer insisted that it was the interpenetration of country with town which was the vital essence of town planning. From every town it should be possible to reach the country through an uninterrupted environment of grass, trees and water. Playgrounds, gardens and parks were the links in the chain which should bind the country to the town.

NEW BRIDGE AT READING.

THE new bridge over the Thames at Reading, opened to traffic last month, is a good example of reinforced concrete construction. As may be seen from our illustration, the bridge is of the arch type, the main span being 180 ft. between springings, which is the largest of its type in the country.

The four main ribs forming the arch and carrying the roadway are tailed down on each side of the bridge by mass concrete abutments, about 50 ft. long by 45 ft. wide, which carry a 12-ft. archway, flanked by piers and panel walls forming the approaches.

The bridge is 40 ft. in the clear between parapets, providing a 27-ft. roadway, with two footpaths, each 6 ft. 6 in. wide. Staircases on each side of the river have been constructed to afford access to the towpath and banks.

In addition to the wing walls on the Caversham side, the viaduct and retaining walls on the Reading side are in reinforced concrete, and a towpath has been constructed on piles under the bridge, clear from the bank, on the Reading side.

The parapets of the bridge are in Portland stone throughout, and, with its low rise, the structure presents a distinctly pleasing appearance. The bridge was designed for the standard rolling loads laid down by the Ministry of Transport, and, under test before being opened to traffic, the maximum deflection was found to be only $\frac{1}{4}$ inch.

Messrs. L. G. Mouchel & Partners, Ltd., 38, Victoria-street, S.W.1, acted for the Reading Corporation as consulting engineers, and the construction throughout was carried out by Messrs. Holloway Brothers (London), Ltd., under the supervision of Mr. J. B. Wilson resident engineer.

Reinforced Concrete Bridge at Reading.

THE SURVEYORS' INSTITUTION.

PRESIDENTIAL ADDRESS.

IN the course of his inaugural address at the opening meeting of the present session of the Surveyors' Institution, MR. J. I. DAVIDSON (President) referred to the steps which were being taken by the principal societies concerned for the better organisation and regulation of the profession by means of a Registration Bill. Since the last presidential address, he said, the Landed Property Practitioners' (Registration) Bill had been drafted. Sir E. Chatfeild Clarke introduced it in the House of Commons, and it was read a first time and ordered to be printed, but unfortunately it was crowded out by prior Bills on the Order Paper on the date allotted for its second reading, and consequently made no further progress during the Session. On the whole that was not perhaps to the disadvantage of the Bill. A certain amount of opposition, friendly and otherwise, to the measure in its original form was disclosed, and the Joint Committee of the three promoting societies had since been engaged in considering amendments which had been drafted with the object of eliminating any opposition for which there seemed reasonable ground. He had every reason to hope that the Bill would be re-introduced next Session in a form which might prove more generally acceptable. It was, therefore, important that members should show that in promoting that legislation they were mainly influenced by a desire to improve and regularise the qualifications necessary for the practise of their profession, and thus to advance the interests of the public by making those who practised it more competent to carry out the responsible and often difficult duties entrusted to them.

There were two other matters of such importance to the profession that the Council had thought it desirable to issue to members special explanatory publications thereon. In May last a Memorandum on the Town-Planning Acts, prepared by the Council with the legal assistance of Mr. William Allen, was circulated; while in September they sent out a Memorandum on the Rent and Mortgage Interest Restrictions Act, 1923, prepared by Mr. Graham Mould, and bringing up to date his work on the earlier measure, which was issued in July, 1920.

With regard to the former a statutory obligation had been imposed on all the more important urban authorities to prepare town-planning schemes within the next six years, and that requirement involved the regulation of development over many thousands of acres. Property ripe for building, or likely to become so in the early future, would be affected in all parts of the country, and it was essential, therefore, that surveyors responsible for the management of land liable to be included in schemes should make themselves familiar with the various Acts and the procedure thereunder. It seemed clear that town planning had come to stay, and the heavy expenses in connection with necessary town improvements imposed upon local authorities by haphazard development in the past would alone seem to justify the movement. In order to be successful, however, it must have general support, and mutual co-operation between local authorities and landowners was, therefore, of first importance. If they acted together and agreed upon the broad outline of the scheme, the details would present little difficulty of adjustment. He urged upon those representing landowners in urban and semi-urban districts to get into touch with the executive officers of town-planning committees and with the agents of adjoining estates, in order to lay down mutually-agreed-upon lines of development. With a determination to surmount difficulties, and a single-minded desire to arrive at a settlement, he felt assured that that could be done, and that in the long run the landowners would benefit by the greater feeling of confidence which would be engendered.

The Memorandum on the Rent Restrictions Act dealt with a matter of even wider present application than the Town-Planning Act, though fortunately it had not the permanent character of the latter.

The Council drew up an exhaustive statement upon the position under the 1920 Act, which formed the text of Mr. Gerald Eve's evidence before the Departmental Committee which was set up by the Minister of Health to consider and report upon the position which would arise on the termination of control in June of the present year. While the Council made a number of proposals for removing or modifying difficulties which had disclosed themselves under the original Acts, they strongly urged that the need for emergency legislation of that class was due to the shortage of houses, and that the only real way of doing away with that need was to strike at its very root by putting an end to factors which militated against their erection. One of the principal was the Restrictions Act itself. The control established thereby had done much to destroy confidence among the three classes whose co-operation was needed to provide houses—the builder, the capitalist, and the investor, and until control had been withdrawn and confidence re-established a vicious circle would be set up in which shortage would be followed by restriction, while restriction would not be removed until the shortage had been made good.

The new Act, while not going so far as those looking to the future might wish, at any rate made a beginning in the withdrawal of control. In certain circumstances properties were freed from restriction, while in other cases the restrictions were made less onerous. The life of the principal Act was terminated definitely in June, 1925, but Part II of the new statute gave certain general powers to the Court to relieve sitting tenants from alleged hardship or oppression for a further period of five years. Part II also empowered the Minister of Health to establish reference committees to whom such questions might be referred by the Court for consideration and report. Those provisions had caused a good deal of apprehension among builders and possible investors in property as setting up a precedent which might be dangerously extended by future legislation. They might, therefore, to some extent counteract the good effect of Part I of the Act in restoring confidence in house property as an investment. They must, however, hope for the best, and trust that, with a renewal of activity in the building industry, a sufficiency of houses might be built during the next two years to remove entirely any real ground for further legislation of that character. He thought all who had a personal experience in housing questions would agree that the growing population could be far more economically housed by private enterprise than by public authorities.

Victoria and Albert Museum.

The west half of the Cast Court at the Victoria and Albert Museum has just been re-opened to the public, with the exception of a small strip at the south end. This court now contains an important series of casts from mediæval English sculpture, including the twelfth-century doorway of Barfreston Church, the carved slabs from Chichester and Bradford-on-Avon, and Romanesque sculpture from Durham and York; the magnificent thirteenth-century angels and Annunciation Group from Westminster Abbey, and a number of casts from the south door and the "Angel Choir" at Lincoln, with details of sculpture from Wells and elsewhere; and a rich collection of casts from fourteenth- and fifteenth-century misericordes, besides recumbent effigies and architectural details.

ARCHITECTS' AND SU VEYORS' ASSISTANT PROFESSIONAL UNIO

The Origin of London and its Building

A JOINT meeting of the Metropolitan b of the Architects' and Surveyors' Assis Professional Union and the Associate Me of the Institution of Municipal and C Engineers was held at the Holborn C Offices last week. Mr. C. A. Austin occ the chair, and Mr. W. R. Davidge, F.R.I. gave a lecture, illustrated with lantern s on "The Origin of London and its Bui By-laws."

After outlining the development of Lo the lecturer said the first Building Act passed in 1189, and was still the foundati our building laws; it mainly dealt with walls. Various other Building Acts had passed from time to time which dealt wit height of buildings in relation to the wid the roads, the overhanging of one story the story below, &c., while the present District Surveyors claimed to be the o descendants of the "Surveyors or S visors" appointed in 1667.

Turning to present-day troubles with crowding on site and traffic difficulties, were shown of various proposed schemes, as surrounding the town with a belt of land. The lecturer concluded with va diagrams of rates, density of population, in the Metropolis to-day.

A vote of thanks to the lecturer was prop by Mr. C. A. Austin, seconded by Mr. Akast (Paddington Borough Surveyor's De ment), and supported by Mr. J. A. Gould Secretary, A.S.A.P.U., Metropolitan Distr

ARCHITECTURAL NOT IN KENYA COLONY

THE Municipal Council of Nairobi elected Mr. Harold E. Henderson, F.R.I. of the firm of Messrs. Harold E. Hende F.R.I.B.A., & Partners, as their Mayor for year. Mr. Henderson is the first elected M of the capital of Kenya Colony, and his app ment adds another name to the list of archi who have undertaken mayoral duties.

The East African Institute of Archi (allied with the R.I.B.A.) are formulati Bill for the compulsory registration of archi in Kenya Colony, which it is hoped wi ready for the first Legislative Counci January, 1924.

A competition for the war memorial Kenya Colony, consisting of a large mem hall, offices, and reference library, has res in the selection of Messrs. Wevill & D A.R.I.B.A., as architects. The compet was assessed by a committee having a assessor Mr. Harold E. Henderson, F.R.I. of Nairobi.

The tower of St. Stephen's Church, Nai Kenya Colony, has just been completed the designs of the late Mr. Temple Moore local supervising architect being Mr. Bath.

Extensions to the Y.M.C.A. in Nairobi just been completed from the designs of Me Giles & Geeson.

UGANDA.

The Public Works Department of the Ug Protectorate are about to erect the Ka (King) of Uganda's Palace department from the designs of Messrs. Harold E. Hende F.R.I.B.A., & Partners, selected in competition.

The premises of Messrs. Whiteaway Lai & Co., Ltd., at Kampala, have been compl from the designs of Mr. H. Hurle Bath Nairobi.

E ROYAL ARCHÆO-OGICAL INSTITUTE.

MEETING of the Royal Archæological ite was held in the apartments of the of Antiquaries, Burlington House, illy, W., on Wednesday last week, pre-ver by Mr. Hewart Bell, who announced rofessor Sir W. Boyd Dawkins had been onally elected by the Council as President, ceed the late Sir Henry Howorth.

paper read by Mr. Aymer Vallance, F.S.A., entitled "A Criticism of Thir-Century Architecture," illustrated by slides, he stated that there were other beside the pointed arch which dis-hed Gothic and Norman architecture, , ribbed vaulting and the flying buttress, the latter belonged the place of first ance. Of early work in which there ed at least the germ of rib-vaulting was pt of Gloucester Cathedral (1089–1100), he rib-vault at St. Nicholas' Priory, . There were not only transverse, but al arches, which in spite of their primitive section could justly be described as ntary ribs. The nave of Remigius's ral, Lincoln, was vaulted in 1092, hat in a measure anticipated Durham ral; but the latter was the first great to be rib-vaulted throughout; the choir n 1099 and 1104, and the nave, with its d transverse arches, between 1128 and The primary purpose of the introduction se of ribs was to enforce the groined g with a permanent centring of stone. mplest form of groined vaulting, identical hat practised by the Romans, was a cross formed by the undersection at right of two semi-cylinders of equal diameter. England the introduction of the ribbed did not immediately effect a change from nesque to Gothic, which cannot be said e come about until the second half of the h century. In 1128 the Cistercian order troduced into England; its puritanical which rigorously excluded every kind of tion, was not without effect, and though difices in the early period were bare and active, they were well considered and y built.

180, at Canterbury, flying buttresses first l themselves in the open air, although appeared earlier at Durham Cathedral y hidden under the aisle roof. It had been hat Gothic builders of the best period l to have been physically unable to do ng in bad taste. The design of even the est churches displayed originality and a feeling for beauty which placed them in the front rank of creative artists. Good taste ruled everywhere; never was anything done to offend; but the lecturer was very far from thinking that the work of the thirteenth century was perfect. The builders of that period, he said, had a great deal to learn, which their successors in the fourteenth and fifteenth centuries happily supplied, at any rate in the way of æsthetics. The difficulties which faced them were so tremendous and absorbing that there was little leisure left to devote to secondary considerations. Their attempts at applied decoration lead one to think that their brains must have been thoroughly exhausted with the effort and strain of constructional problems, and that they had no power to develop the ornamental side of architectural composition. Such decoration as did occur was often neither logical nor coherent, and this defect was particularly noticeable in the treatment of the spandrel of thirteenth-century work.

A vote of thanks was passed to the lecturer.

THE BRITISH EMPIRE EXHIBITION.

On Monday the Palace of Industries and the Palace of Engineering at the British Empire Exhibition, Wembley, were, on their completion by the contractors, Messrs. Sir Robert McAlpine & Son, officially handed over to Sir Travers Clarke on behalf of the Board.

After luncheon at the Great Central Hotel, Marylebone, at which Sir Travers Clarke presided, a party proceeded to Wembley for the purpose of inspecting the buildings, and watching the ceremony of handing over the two golden keys—a symbol that the two buildings had been officially handed over.

In a short speech Sir Robert McAlpine said that the best thing he could do would be to let the buildings speak for themselves. He further mentioned that the buildings now reaching completion were the largest concrete buildings in the world. Fifty years ago Scottish peasants would not believe that concrete buildings could possibly keep standing; they were under the impression that the elements would cause them to fall down like a pack of cards. Now, however, his triumph is complete; his faith vindicated. Certainly the white beauty of the Palaces themselves, the delicate minarets, and the graceful bridges spanning the artificial lake, represent something historic in exhibition building.

Sir Travers Clarke, in reply, said that the contractors had actually finished their contract a day before its termination.

Alterations to the "Mitre" Hotel, Oxford.

MESSRS. RICHARDSON & GILL, FF.R.I.B.A., Architects. *(See our last issue.)*

EXHIBITION NOTES.

THE R.B.A.

It is well, perhaps, that a foreword to the catalogue of the 116th exhibition of the Royal Society of British Artists reminds us of the courage of the Society in attempting to discover and help on budding talent, and that upwards of a quarter of a million pounds and numerous commissions have come to artists who have exhibited on the Society's walls. There are many exhibitions afoot nowadays, but budding artists still find it hard enough to find a happy and successful location for their works, notwithstanding the fact that such a large number of pictures would be as well left in the obscurity of the studios. The admirable display of water-colours in the large gallery of the Society should prove attractive to the public, and there are certainly amongst them quite a fair number which deserve their publicity. A strong, vigorous drawing of some distinction is that of Château de Montgorguer (205), by E. A. Cox (the winner of Parsons' decorative colour competition). The "Impotence of Opulence" (204), by Charles Ince, which hangs about the first-named drawing, is a fine study in greys of a ruined castle. A. E. Cooper's two drawings of Ludlow (202 and 206) are telling subjects broadly treated. "Low Tide" (198), by Ernest W. Haslehurst, is a delicate and pleasing impression of grey and green. "The Auld Brig" (190), by A. Carruthers-Gould, is quite a masterly sketch of its sort. A charming and poetic drawing in grey-greens is "Il Monastero" (173), by St. Clair Marston, admirably and —may we not say?—lovingly painted. A clever little impressionist sketch in genuine water-colour is the "Slopes of the Pyrenees" (171), by A. H. Elphinstone. Solomon J. Solomon, the gifted president, is not at his best in his exhibits 167 and 166. A good impressionist sketch of "Entrance to the Old Bailey" (140) is by Barry Pittar. An excellently rendered portrait sketch by Dorothea Sardau de Fano is the Dr. Ernest Barker, M.A., evidently a good delineation of character. In "The Homeland Twilight" (105) Fred F. Foottet gives us another of his striking decorative panels, but this time it appears to us just a little too strident: strong as his work always is he has generally great judgment: his "Dorset Barn" (229) seems to us a very perfect piece of work of its kind. There are several other drawings which claim notice, such as Barry Pittar's large water-colour of the High, "Oxford" (254); "The Horses at St. Mark's, Venice" (268), by Mabel Bruce Low; Leonard Richmond's glowing pictures (38, 276, and 281); Arthur Spooner's dainty figure subjects (320 and 326).

THE WALKER GALLERIES.

At the Walker Galleries there is a wonderful exhibition by the Embroiderers' Guild, showing how beautiful and varied in effect the work of the needlecraft may become. Examples from France, Holland, Spain, and Sweden are remarkably fine and the work contributed by our own and other Queens is a fascinating part of the show. The exhibition will repay a close and critical examination, and prove that in technique we can still compare favourably with almost anything which has been done. A small exhibition of clever impressionist sketches by Mary Hogarth is on view at these galleries.

THE GARDNER COLLECTION.

Time will be all too short for any fair appreciation of the wonderful Gardner Collection at Messrs. Sotheby's, and architects will especially regret the dispersal of such a valuable and amazingly large record of London as was here collected. One realises so fully from these engravings much of the charm of old London, as, for instance, in the folio containing the illustrations of old Buckingham House and Hungerford Market.

THE BUILDING TRADE.

ESTIMATING FOR SMALL BUILDERS.—IX.

By J. H. BARNS, F.I.O.B.

GENERALLY.

It will be observed that in these articles the labour or production costs are mostly stated in money values for work in the London area. If it were desired to obtain comparative figures for some areas where the rate of wages is lower than in London these could be obtained by comparing the wages paid according to the list of local wages in *The Builder*, and the difference can be expressed by a percentage off the money values stated. The practical way of dealing with production costs is by stating them in a money value; the theoretical method is by separating the money value into hours of mechanic's and labourer's time, regardless of the fact that machinery may have to be utilised for the job. Production costs may or may not include cost and use of machinery for particular work in question, as, for instance, the use of crane in excavation or brickwork and motive power for stonework, and it is somewhat unpractical to express such costs in hours of mechanic and labourer when part of the work has been performed by machine. What the average builder wants to know is some idea of the amount that other firms are paying for their production costs; it is then up to him to produce his work at the same or a lower figure, using any mechanical devices which may seem to help in the required direction.

PLUMBING.

The first item is usually lead laying to flats, the total weight being stated, but it is not usual to state the weight of sheet lead in lbs. per foot. If it is a large lead flat it is necessary to carefully set out the size of the bays to fit in with some ordinary size to which sheet lead is rolled, so as to avoid unnecessary cutting and waste. The sheets of lead are rolled to about 30 ft. in length and 7 to 8 ft. in width, and are from 3 to 8 lbs. per ft. super in thickness. Other thicknesses are rolled, but they are not ordinarily used by builders.

The price of sheet lead frequently fluctuates. The following are the current prices of lead in sheets and pipes supplied by merchants and delivered in London:—

Milled sheet lead in sheets 4 lbs. per ft. super and upwards ..	36/6 per cwt.
Do., but 3 lbs. per ft. super, 10/- per ton extra	37/- „ „
If cut to under 15 ft. by 7 ft., that is less than half-sheet is ordered, additional charge	2/- „ „
If cut and less than 5 cwt. is ordered, additional	3/- „ „
If cut into strips under 6 in. wide, say for flashings for a large quantity, extra	2/6 „ „

ADDITIONAL CHARGES IF SMALL QUANTITIES ARE ORDERED.

Under 5 cwt. and not less than 3 cwt., extra	1/6 per cwt.
Under 3 cwt. and not less than 1 cwt., extra	3/- „ „
Under 1 cwt., extra	4/- „ „

The basis price for lead pipes is 10s. per ton, or 6d. per cwt. over the price of sheet lead = 37/- per cwt.

The basis price for lead soil pipe is 3/6 per cwt. over the price of sheet lead = 40/- per cwt.

The same extras for cutting and supplying lead pipe in small quantities as for sheet lead, except that it is not usual to charge for cutting when half-coil of lead pipe is ordered.

The following example will give some indication as to how these charges by the lead merchant work out if under 4 cwt. lead pipe is ordered.

Example:—

Basis price of sheet lead ..	36/6 per cwt.
Extra for pipe	6d. „ „
Cutting to lengths if so ordered	3/- „ „
Extra for small quantity ..	1/6 „ „
Total	41/6 „ „

Example:—

Say 4 cwt. sheet lead cut to any rectangular size required:

Basis price	36/6 per cwt.
Cutting	3/- „ „
Small quantity	1/6 „ „
Total	41/- „ „

Say 1 cwt. sheet lead cut to any rectangular size required:

Basis price	36/6 per cwt.
Cutting	3/- „ „
Small quantity	4/- „ „
Total	43/6 „ „

Say 4 cwt. sheet lead cut into strips, 6 in. wide:

Basis price	36/6 per cwt.
Cutting	3/6 „ „
Small quantity	1/6 „ „
	41/6 „ „

The labour of laying lead to flats, including dressing over the rolls, costs about 10s. per cwt. Gutters and ordinary cover flashings are worth about 12/6 per cwt. The ordinary description of flashings usually includes both cover and stepped flashings. The labour to stepped flashings is considerably more expensive than the ordinary cover flashings, being worth at least 20/- per cwt. for labour, but it is not unusual to price them all at the same rate. Lead soakers cost about 6/- per cwt. for labour, and are often priced at about the same rate as lead flashings.

Lead being a somewhat expensive item, it is necessary for the sheets to be carefully set out so as to be cut with the least possible waste. The amount included for waste—5 per cent.—is an approximate figure to cover the waste and possible loss on the cutting up of the lead sheets. It is not unusual for some firms to set out the exact sizes of the lead required, and get a quotation from the lead merchants for the material ready to fix. The advantage of this method is that the builder can see at once exactly how he stands in relation to his quantities, but in practice this would seem to somewhat retard the progress of the work, as it would be impossible to obtain all the sizes required for the sheet lead at an early stage of the job, and this method would probably result in a delay in getting the material.

Example:—

Cwts.

— Wt. milled lead and labour in laying to flats.

	£	s.	d.
Milled lead, per cwt.	1	16	6
Waste, etc., 5 per cent.		1	10
	£1	18	4
Labour		10	0
	£2	8	4
Profit and oncosts, 15 per cent. ..		7	3
Per cwt.	£2	15	7

Bossed end to rolls, 1s. each.

EXTRA LABOUR AND SOLDER TO CESSPOOLS.

No particular size being stated, it is, therefore, difficult of analysis. All that is involved is the additional labour and the soldered angles of the cesspool. The labour to the lead is already included in the weight, and there is little e labour on the cesspool apart from the a already stated. They are worth from 6s 10s. each. In respect of soldered dots, sinking of the woodwork underneath is us measured in the carpenter, and what is req is to dress the lead into the sinking and brass screw and solder over, and this for la and solder is worth about 1s. 3d. each. buttons for securing lead on top of a s cornice are worth about a similar amo although there are so many sizes of these weight of the lead would be a consider factor in arriving at the price.

With the great advancement made in sani science and the improvement in constructi sanitary apparatus, care is needed in the arra ment of pipes and the selection of materia which they are made. If the water supp to be obtained from the Metropolitan W Board the pipes must be in accordance their requirements as to weight and thick of metal. The weights are:—

½ in. dia. rising main, 6 lbs. yd. run, gene known as 30's, *i.e.*, 30 lbs. per 15 ft. ru

¾ in. dia. rising main, 9 lbs. yd. run, gene known as 45's.

1 in. dia. rising main, 12 lbs. yd. generally known as 60's.

1¼ in. dia. rising main, 16 lbs. yd. generally known as 80's.

For waste pipes or pipes with open ends, usual weight is:—

¾ in.	waste pipes	5½ lbs. per yd. ru
1 in.	„	9 „ „
1¼ in.	„	13 „ „
1½ in.	„	15 „ „
2 in.	„	21 „ „

All the water fittings must be stamped the Metropolitan Water Board that they a accordance with their requirements, and rightly insist upon a good standard of fitting. pipes may be used for water supply, but th the objection that the water causes the pip rust, which is apt to stain the basins. Wro iron pipes are made in three qualities—th welded gas tube, water tube, and steam t The gas tube is supplied painted black, the w tube blue, and the steam tube red.

If the water is not obtained from the W Board, but is obtained from a well sunk or consumer's premises, this may possibly pro very soft water which will have a soft corr effect on the metal, and is likely to make joints and welds of iron pipes leak. Well w will have a similar effect upon boilers whic used for heating water for domestic purp causing a corrosion of the joints and sean the boiler. This can be obviated by tre the boiler with "Bower Barff" process using copper boilers and copper pipes. latter, of course, are very expensive.

Small lead service pipes are usually sol coils of 60 ft., and the larger pipes eithe 36 ft. coils or 10 or 12 ft. lengths. In a c class of work the lead pipes would be fixe the wall with iron wall hooks, and consis with the usual soldered joints. In a b class of work the pipe is secured with lead t which are soldered on to the pipe and fixed nails to wall. The tendency nowadays i make soldered joints (sometimes called "e joints) less obtrusive, and consequently solder would be required for such work.

The amount of solder used for joints is usu calculated by taking the unit amount in of solder, thus:—

1 in. pipe should require 1 lb. solder for j

4 in. joint required 4 lbs. solder.

In practice these figures are likely t somewhat different, as they depend on the of the plumber's mate and the care of plumber. If the plumber's mate lets the p pot get continually red hot the solder will w and turn to dross, and the plumber mus

ıl to see that all the metal he spills is ned to the pot for re-use.

s are measured separately for all pipes " dia.

lead tacks included are for the simplest ainest description; should heavier or nental " tacks be required the additional ust be added. The labour is for the ing carried out under the most favourable stances. The labour is stated at the same the heavy service pipes and waste pipes. ormer are usually in longer and straighter than the latter. With respect to the per ft. run of lead pipe, should the e state what weight is required, it should fully compared with the Water Board's ons to see that it corresponds, as pro- n another part of the estimate there a clause to state that all the work mply with the regulations of the local ties.

pipes are supplied in about ten different or thicknesses for each diameter of pipe, a list of which can be obtained from lead merchants. Sometimes the pipes are specified to be light, middling, or strong. These are only general indications of what is required.

Example :—

— ft. run 4 in. lead soil pipe and including all running joints and lead tacks soldered on 3 ft. 6 in. apart, and securing with galvanised nails.

10 ft. run 4 in. × 7 lb. lead soil pipe weight 76 lbs., at 40s. cwt. ..	£1	7	2
Waste, 2½ per cent.			8
4 lbs. solder		4	0
Nails, &c.			6
Labour fixing	1	0	0
3 lead tacks, say		1	8
For 10 ft. run	£2	14	0
For 1 ft. run		5	5
Add for profit and oncosts, 15 per cent.			10
Per ft. run..		6	3

It is worth about the same price for labour per ft. run for both 3½ in. and 4 in. diameter lead pipes.

The cost of branch joints will depend upon whether they are wiped on the bench or in position.

LABOUR AND SOLDER TO BRANCH JOINTS.

Size of pipe.	4 in.	3 in.	2 in.	1½ in.

Heavy brass socket thimbles and two joints.

For pipe.	4 in.	3 in.	2 in.
	9/6	.. 8/6	.. 6/6
Add profit and oncosts 15 per cent.	.. 1/5	.. 1/3	.. 1/–
	10/11	.. 9/9	.. 7/6

The cost of fixing sanitary fittings will vary considerably with the quality and style of apparatus. The approximate cost of fixing only to sanitary fittings, including bedding and fixing all valves, overflows, washer plugs, and unions and making all joints required :—

Baths	9/–
Lavatory basins	5/–
W.c.'s and waste preventors ..	9/–
Sinks	4/6

The attendance on these items by other trades is usually measured separately.

There are many types of water waste preventors. Those used in the Metropolitan Water Board area are required to be stamped by them. The most useful type is the valveless waste preventor, as if a cistern is used that has valves in its flushing gear it is likely to be continually getting out of order. A cheap and quite a good type of the valveless cistern is the "Burlington" pattern, which is in fairly general use. It consists of a bell or dome which, when lifted, sets up the syphonic action and causes the flush.

There are many similar makes and patterns, and the only real objection to them is that they are somewhat noisy in use and have rather a heavy pull, otherwise they can be recommended. Waste preventing cisterns can be rendered less noisy by fixing a short length of pipe inside the waste preventor, so that the water from the ball valve discharges at the bottom of the cistern and not at the top, thus obviating the noise caused by the water running in. There are various patterns of what are called silent waste preventors. These sometimes consist of some arrangement of valves which sooner or later get out of order.

The following are the prices of a few of the well-known makes of ordinary cisterns :—

2 gall. "Burlington" light pattern water waste preventor (painted) including brackets and chain pull	12	3	each
Do. do. slightly heavier do.	13	6	,,
Do. do. extra heavy do. ..	15	6	,,
Do. stamped N.R. and do. ..	17	6	,,
(If galvanised, about 8/6 each extra.)			
Shanks' "Reliable" waste preventors (painted)	25	6	,,
Doultons' "Paisley" cistern ..	48	0	,,

These prices are for waste preventors with a good head of water above and fitted with high pressure ball valves, but if a low pressure ball valve is used to be suitable for positions where the head of water is not great the cost would be about 1s. 6d. each extra.

The cheapest kind of flushing pipe are the galvanised steel rustless ones, which are bent and jointed in the centre, being about 3s. 6d. each. They have to be connected to the water preventor and the w.c. basin with a proper cone joint. The cost of w.c. basins will depend upon the type of fitting selected, whether they are earthenware or fireclay, whether they are white inside and out, or cane glazed outside and white inside. They must be glazed on all surfaces including the flushing rim. The prices vary from 15s. to £5 each.

It is customary nowadays to fix the w.c. seat to a lug on the w.c. basin with a couple of nickel-plated bolts, and the seat should be hinged with side hinges. The best are usually made in two thicknesses of wood. Seats with lids are now rarely used.

Deal or whitewood seats ..	9/– to 12/– each
Polished mahogany ..	21/– to 35/– ,,

REPAIRING LEASES: "STANDARD OF REPAIR"

A DECISION of great importance has been given by a judge of the High Court in the recent case Calthorpe *v.* McOscar and others (1923 2 K.B. 573) as to what is the standard of repair which can be required at the expiration of a long lease containing a provision that the premises should be "well and sufficiently repaired," where the character of the neighbourhood has changed.

The facts were shortly as follows. In 1825 a lease of three houses in Calthorpe-street, Gray's Inn-road, had been granted by the plaintiff's predecessor in title to the defendants' predecessor in title for a term of 95 years from June, 1824. Thus the term expired in June, 1919. At the time this lease was granted the houses were newly erected, and the lease provided that the lessee, his executors, administrators, and assigns should "from time to time, and as often as occasion should require during the said term, well and sufficiently repair, support, uphold, maintain, paint, pave, empty, scour, cleanse, amend, and keep the three several messuages and buildings thereby demised, and all such other buildings as should during the said term thereby granted be erected upon the said ground and premises thereby demised, and all the walls, fences, pavements, vaults, cellars, sinks, privies, sewers, drains, watercourses, and other appurtenances belonging or to belong thereto, in, by and with all and all manner (sic) of needful and necessary reparation and amendments whatsoever . . ." and the lease provided that the premises as above defined, being so well and sufficiently repaired and kept, etc., etc., at the end or sooner determination of the said term should be surrendered or given up.

The plaintiff brought the action for a breach of the above covenant, and in that action an order was made by consent that the amount of damages recoverable should be referred to an arbitrator, a surveyor. The arbitrator made his award in the form of a special case for the opinion of the Court. The award stated that there was no dispute, that the measure of damages to be recovered for breaches of the covenant to repair was the cost of the repairs rendered necessary when the term ended by the defendants not having performed the covenant, but that the parties differed as to the nature and extent of the repairs that were necessary for the due performance of the covenant. The defendants contended that the effect of the covenant was limited to imposing an obligation to carry out only such repairs as having regard to the age, character, and locality of the premises, would make them reasonably fit to satisfy the reasonable requirements of reasonably-minded tenants of the class that would be likely to occupy them; but the plaintiffs contending that under the covenant the defendants were made responsible to do all needful and necessary acts, well and sufficiently to repair the premises, in the words of the covenant, without limitation to such repairs as would satisfy the class of persons likely to become occupiers of the premises.

The arbitrator found as a fact that the tenants likely to occupy the premises would only take the houses separately, or only part of a house for short terms on weekly, monthly, or quarterly tenancies, and would not accept any repairing obligations, and that the requirements of reasonably-minded tenants of such class would not include many repairs which in the opinion of the arbitrator were needful and necessary for the repair and maintenance of the property, and he therefore assessed the cost of the repairs on a double basis. If the contention of the plaintiff was correct, then, making due allowance for the age of the premises and the change in the residential character of the locality, he estimated the necessary repairs at £586, but if the defendants' contention was correct he placed the sum at £220.

We are not aware that the point raised here has ever been taken in any case concerning a repairing lease before, and therefore it is necessary to examine the judgment and the cases quoted with some particularity. The judge put the point thus: "The standard of the surveyor is one thing; the standard of the reasonably-minded tenant seems to be another thing." The judge, as regards the change in the neighbourhood, says: "Exerting common knowledge, I presume the meaning of the matter is this—In 1825 the three houses in Gray's Inn-road were country abodes—Gray's Inn-road was then a semi-rural area. With the growth of population it has slowly changed. It is now a busy and central part of a great city. The three houses or parts of them will now be let to small tenants who have their occupation near." And he proceeds to observe that in view of the profusion of case-law it seems impossible that the point of law should now call for decision, but that the question has given him difficulty and the case-law is in a confused state.

We dealt with this question at some length on December 8, 1911, in the case Lurcott *v.* Wakely (1911, 1 K.B. 905), where we reviewed the decisions, but most of them have turned rather upon the point whether the age of the structure had changed its character, so that it could not be put in the condition required by the covenant without practically creating a new house, and in Lurcott *v.* Wakely the majority of the Court of Appeal appear to have taken the extreme view that a covenant that required the tenant to "well and substantially repair and keep in thorough repair and good condition" might even involve replacing the house as a whole, but, as a matter of fact, the point decided in that case was that the operation required the erection of the front external wall, was only a subsidiary operation, and came within the covenant. A great deal of confusion in the cases has been caused by the variety of the terms of the covenant to repair, and the different construction placed upon the various expressions, and therefore it is important to note that the judge in the case we are considering, after having read and reviewed the decided cases, came to the following conclusion: "I am of opinion that none of the expressions in the various decisions cited by me add anything to the word 'repair.' That word denotes or connotes all that which is indicated by the words 'well' or 'proper' or 'substantial' or 'sufficient' or 'good' or 'necessary' or 'tenantable.' This is, I think, a useful and convenient rule to establish and it is agreeable to the bulk of authority."

This is a most important pronouncement, and if it is adopted it will do away with most of the difficulties which are experienced in practice from the multitude of decisions turning on small differences in covenants to repair, but hitherto the Courts have distinguished between the various expressions. The decision relied upon by the tenant in this case was Proudfoot *v.* Hart (25, Q.B.D. 42), and the words of the covenant in that case were "tenantable repair." We believe that case only turned on the condition of certain woodwork in a house, but the headnote to the case is "Under an agreement to keep a house in good tenantable repair and so leave the same at the expiration of the term the tenant's obligation is to put and keep the premises in such repair as, having regard to the age, character and locality of the house would make it reasonably fit for the occupation of a tenant of the class who would be likely to take it." We have not the full report of that case before us and, therefore, are unable to say how far the question of change in locality was argued, but the judge, in the case we are considering, held that that decision did not turn on any special words in the covenant or on any special facts, and that it was applicable to the case before him, and he adopted it and fixed the cost of the repair at the lower figure named by the arbitrator.

He is reported as saying that in his opinio Proudfoot *v.* Hart supplies a useful workin rule for the normal covenants to repair, how ever variously they may be worded; tha some standard must be taken, and if the ex treme views of both landlord and tenant ar excluded then the views of that hypothetic person, the reasonable man, can only be take as supplying the test, and that person is ind cated in Proudfoot *v.* Hart.

This judgment is a common-sense jud ment, and if, in the course of time, it allowed to stand as the law by the courts appeal the law of landlord and tenant wi have been materially simplified to the bene of both landlord and tenant, for to understar the law is nine-tenths of saving the costs the law in litigation. We must add one wo on the question of the varying words used covenants, for it is necessary to say that t judge expressly excluded such speci covenants as to paint at particular period and confined his observations to the gener expressions used in such covenants.

RAILWAY COMPANIES' LIABILITY FOR DAMAGES.

IN the recent case, Nunan *v.* Southern Railwa Company (*Weekly Notes*, November 3), the Cou of Appeal has decided a point of importan where a passenger has been killed by negligenc and the claim is made for the death of th deceased under Lord Campbell's Act.

The deceased passenger was a workman bei carried on the express terms of a workman ticket with the condition, "The liability of th Company is limited to a sum not exceedi £100." This action was being brought by h widow under Lord Campbell's Act for damag for his death, and the question raised was wheth her claim to damages was limited by the agre ment between her deceased husband and th Company as to the limit of damages, and it important to note that the Court of Appe decided that this is not the case. Section 1 Lord Campbell's Act (The Fatal Accidents Ac 1846) provides: "Whensoever the death of person shall be caused by wrongful act, negle or default and the wrongful act, neglect, default is such as would have entitled the par injured to maintain an action and recov damages in respect thereof, the person wh would have been liable if death had not ensue shall be liable to an action for damages no withstanding the death of the person injured Section 2 provides that the action shall be f the benefit of the wife, husband, parent, an child of the deceased person, and "in eve such action the jury may give such damag as they may think proportioned to the injur resulting from such death to the parties respe tively for whom and for whose benefit suc action shall be brought."

The Court of Appeal held that, since it w established by a series of authorities, includi Seward *v.* Vera Cruz (1884, 10 App. Cas. 5 and British Electric Railway Co. *v.* Genti (1914, A.C. 1034), that the cause of action giv to the widow was entirely distinct from th cause of action the deceased would have ha involving a different measure of damages, th only point for the Court to consider under th Statute was whether the deceased could ha maintained an action and recovered damag if death had not ensued, and here the deceas could have recovered some damages, thou the amount might have been less than he w entitled to by reason of his agreement, therefo the action could be brought by his widow, an her action being separate from the cause action of the deceased, was not subject to th limit of damages contained in the agreeme with the deceased. The Court below ha awarded £800, and the appeal of the defenda Company was dismissed.

UNEMPLOYMENT INSURANCE.

The report of the Minister of Labour on employment Insurance, a summary of which peared in *The Times*, October 25, contains tter of great importance, as it covers the iod of ten years since the last report. The tative scheme of 1912 only covered some and a quarter million of workpeople ployed in certain specified industries, but Act of 1920, which extended this scheme, lies to some eleven and three-quarter lions.

Ve have always regretted that the war erfered with the working of the scheme from point of view of accurate actuarial statistics, has prevented the normal working of rance schemes from being accurately ged. The limited scheme of 1912 was erfered with by the stress of war making mployment unduly small, whilst the after-th of war since 1921 has inflated unemploy-nt to an unprecedented extent, and thus this nt experiment has never been working in mal conditions. In the year 1918–1919 the -of-work donation paid to civilian workers, for sixteen months longer to ex-Service men women, also upset the statistics, as persons e not allowed to draw from both sources, hence the unemployment benefit funds efited, for the donation rate was the higher he two.

he Act of 1920 came into operation in ember of that year, just about the time t it became apparent that a period of mployment must be looked for, as a conse-nce of falling trade, and therefore it is venient to start from the statement con-ed in the prefatory note to the report which es: "During the past two and a half years unemployment insurance scheme has been principal means of coping with a volume of mployment unprecedented in the industrial ory of the country—£128,000,000 has been d in benefit in that period. Of this large a three-fourths has been provided by, or will a future charge upon, insured workpeople their employers. Not more than one-rter of the sums now being paid in benefit of the costs of administration is provided the taxpayer." This represents at the sent time the whole of the Exchequer tribution to the scheme.

n connection with this statement it is portant to observe that the sum borrowed meet the excessive strain put upon the rance fund, largely due to the granting of ncovenanted benefit" during the present ress up to the end of June last, was ,600,000, and it is this sum which is spoken as the future charge which will be repayable the workpeople and employers, but the ort states: "This, though a large sum, is at all disproportionate to the resources of unemployment fund, which has at present annual revenue of over £47,000,000," and nat the debt is not so large that it cannot paid off in a comparatively short space of e as soon as trade revives" and the financial bility of the scheme can be re-established.

he report desires to combat a widespread pression that unemployment benefit, or at rate so much of it as is "uncovenanted," provided by the taxpayer, and states that -fourth and no more of the sums now being d in relief and of the cost of administration s upon the Exchequer. The "uncovenanted" ef as distinguished from covenanted benefit explained—"Covenanted benefit" is benefit wn as of right by virtue of contributions; ncovenanted benefit" is a discretionary nt to unemployed persons who were normally ge earners in insured trades, and were uinely seeking whole-time employment, but o have exhausted their rights derived from ment of contributions, or who, in excep-nal cases, have even paid no contributions. e report points out the distinction between ncovenanted benefit" and poor law relief. Only persons who are normally insured can draw the former, "which is, in fact, in the nature of an advance made on the faith of future payment of contributions." During the year 1922–3 it is stated that the sum of £9,450,000 in poor law out-door relief was paid to persons falling within the unemployment insurance scheme, and their dependants, in England and Wales, but "the proportion of persons in receipt of unemployment benefit also drawing relief is not precisely known." In Birmingham, where this question was tested, the proportion was about 17.3 per cent., but this, the report states, cannot be taken as typical of other areas.

The ratio of administrative expenses is 8.3 per cent., and this includes not only the organisation required for collecting benefit and assessing and paying it, but also 95 per cent. of the whole cost of the unemployment exchanges. The total contributions from employers, employed, and the Exchequer from the initiation of the scheme in 1912 to July 31, 1923, are employers, £48,000,000; employed, £44,600,000; Exchequer, £31,500,000; and the loan above mentioned and the interest thereon are repayable by the employers, employed, and the State approximately in the proportions indicated above. From this very short review it will be seen that the report is full of information which deserves careful consideration.

BOOK REVIEW.

The British Acetylene and Welding Handbook. (London: 30, Red Lion-square, W.C. 1.) Price 7s. 6d. net.

This eminently practical handbook should be read and kept for convenient reference by all users of acetylene in any form if the best results are to be obtained and risk of explosion avoided. Acetylene is either a very safe and convenient or an extremely unsafe and inconvenient form of illuminant and heating agent, according to the methods employed in producing, storing and using it. It is not only necessary that all apparatus connected with its use should be designed to be practically fool-proof, but every person proposing to employ it should be instructed in detail as to the points to observe in handling the apparatus and dealing with the gas.

These matters are set forth in this book, issued by the British Acetylene and Welding Association, from both the theoretical and the practical point of view, and notes on the history and chemistry of acetylene will be found in it, together with instructions in the practice of metal cutting and welding by the use of the oxy-acetylene flame. Although the high temperatures produced have caused the oxy-acetylene combination to be associated chiefly with metals of high melting point, the authors also recommend its use for making joints in lead and other easily fusible metals.

For minor operations, such as paint burning, an acetylene-air blowpipe has been produced for which it is claimed that it is far more efficient and cleaner than the old-fashioned blowlamp, and permits of the paint being removed with a wide scraping edge in something like half the time formerly taken to do the work.

Some micro photos of steel sections, showing the crystalline character of the material, are highly interesting in that they indicate the degree of union that can be obtained under good conditions by the use of a suitable feed wire and pure acetylene, and the failure that is liable to follow the use of unsuitable material and impure gas.

Acetylene lighting installations are described and illustrated by diagrams of generators made by several firms. The points claimed in favour of acetylene as an illuminant for isolated buildings, or in places where the supply of coal gas or electricity is dear and inefficient, are: (1) The small amount of attention necessary to keep plant and fixtures in good running order; (2) safety; (3) cleanliness; (4) the cost of installation; (5) the cost of maintenance and general upkeep; (6) the quality of the light.

"The softness of the light and the absence of glare (experienced with other modern forms of lighting) puts acetylene far ahead of other illuminants." Some suggestions are made as to the utilisation of the residue left after the production of acetylene from calcium carbide. The residue is in fact slaked lime with some impurities, and can be used with advantage for making mortar and various agricultural and horticultural purposes.

INFRINGEMENT OF TRADE MARK.

In the Chancery Division, on November 6 Mr. Justice Tomlin had before him a motion by Major & Co., of High-street, Borough, S.E., against the Dorset Farmers' Union to restrain the latter from passing off creosote and similar preparations as "Solignum," and from infringing the plaintiffs' trade mark.

Mr. Greene, K.C., for the plaintiffs, said that his clients were the makers of a well-known product called "Solignum," which was a good preservative from the ravages of the death watch beetle and was very destructive to that insect. It had become somewhat largely used, but it differentiated largely from the ordinary creosote. It had, however, become known to the plaintiffs that creosote was being passed off as "Solignum," though the latter was a very expensive article, costing 4s. 6d. a gallon, while ordinary creosote could be bought at 1s. 7d. It was known that manufacturers had great difficulties in detecting infringements and passings-off of this kind, but in the present case it was a very different state of affairs. A Captain Hewart ordered from the Wimborne branch of the defendants' Union a ten-gallon drum of "Solignum." In response to that order he received a ten-gallon drum followed by an invoice which made the charge as 17s. 6d., which worked out at a price of 1s. 9d. per gallon. He was suspicious of the goods, perhaps more from the quality than the cheapness, and he communicated with the plaintiffs, suggesting that they should analyse the goods. The result was that the article supplied was found to be ordinary creosote or some mixture, and it was another article. The defendants were communicated with in turn by the plaintiffs, who said they could offer no explanation, but added that they understood Captain Hewart wanted ordinary creosote, and they had no intention of forcing upon him the creosote for the plaintiffs' "Solignum," as was shown by the price charged.

His Lordship granted a perpetual motion against the defendants, who consented to it being taken as the trial of the action, and made the usual order for the defendants to pay the costs.

London Chamber of Commerce.

At the meeting of the Council of the London Chamber of Commerce on November 8, Mr. A. de V. Leigh, M.B.E., M.A., was appointed Secretary of the Chamber in succession to the late Mr. Charles E. Musgrave.

NEW BUILDINGS IN LONDON.

Embankment. — SHELTER. — Messrs. J. McManus, Ltd., of 237, Hammersmith-road, W.6, are erecting a weather shelter at the Victoria Embankment near Blackfriars Bridge, for the London County Council in accordance with the drawings and specification prepared by the Architect to the Council, Mr. G. Topham Forrest, F.R.I.B.A.

Kensington High-street. — ALTERATIONS. — Alterations are being carried out at Nos. 5–7, Young-street, by Messrs. Hall, Beddall & Co., Ltd., under the direction of Mr. Edgar S. Underwood, F.R.I.B.A., for Messrs. Story & Co., Ltd. The works consist of removing roof to rear portion, and constructing additional story, and thoroughly re-conditioning and re-organising the culinary department. The steelwork is being executed by Messrs. Drew-Bear, Perks & Co., Ltd., and other sub-contracts are now being arranged.

Isleworth.—BANK.—A new bank is now in course of erection for the Westminster Bank, Ltd., at Isleworth. The builders are Messrs. J. McManus, Ltd., of 237, Hammersmith-road, W.6, and the architect is Mr. G. W. Stanley Burmester, F.R.I.B.A., F.S.I., of 15, Queen Anne's-gate, S.W.1. All sub-contracts have been let.

Hammersmith.—BUILDING.—A new contract has recently been entered into by Messrs. J. McManus of 237, Hammersmith-road, W.6. The contract is for the demolishing of the old building and erecting a new block of premises in Hammersmith Bridge-road, for Messrs. Palmer's Stores (1903), Ltd. The architects for the work are Messrs. J. S. Quilter & Son, 3, St. James's-street, S.W.1. The sub-contracts are all let.

BRISTOL EMPLOYERS AND HOUSING.

THE housing shortage was discussed at considerable length at a meeting of the heads of many of Bristol's most important industries, and as an outcome it has been decided to re-form the old Bristol Garden Suburbs Company under the name of Bristol Housing, Ltd., with a capital of £120,000.

The Lord Mayor presided, and said the suggestion was that those who had large businesses might feel inclined to help by putting part of their reserve fund into this undertaking. They would make sure of a dividend, and at the same time would be helping what was now a trouble to every right-thinking man. The chairman of the company since its incorporation, Mr. G. H. Oatley, had consented to act for a period of two years, if desired, while Mr. Frank N. Cowlin had agreed to act as managing director for two years from the date of the prospectus. Both were willing to act without any remuneration to help the situation.

Mr. F. N. Cowlin said a subsidy of £120 per house would be obtainable, and the houses could be built to show a return of five per cent. on the investments of the company. A capital of £120,000 would enable the company to build 300 houses, assuming that they sold none, on a rental basis of 11s. 6d. per week, on a cost of £425. They could be sold for about £450 each, and the purchaser could borrow 90 per cent. of the value, and by a payment of 10s. 1d. or 12s. 1d. per week, including ground rent, could own the house in 20 years, and be a property owner in the city, which would be a valuable asset to the city. He read a letter from the Imperial Tobacco Company offering to invest £50,000, and he said it seemed to him that the only way they could get on was for a company of business men to get together to take the place of the speculative builder. His own firm was prepared to subscribe £5,000 and assist the company in any way it could.

Promises of support were given by most of the heads or representatives of the firms present, and at the end of the meeting the Lord Mayor announced that £71,000 had definitely been promised.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

(For rates of wages in the Building Trade in Scotland, see page 783.)

THE SCOTTISH BUILDER

NEW METHODS OF BUILDING.

the opening of the session of the Royal ical College Architectural Craftsmen's y, Glasgow, a paper was read by Mr. Houston, A.R.I.B.A., on "New ds of Building."

al conditions, he said, governed to a extent the construction which should be n various districts. For instance, in a g area the best method to adopt was the frame structure, veneered with stone, , concrete, or cement reinforced with ded metal. In this type of construction forced concrete raft was laid over the site and the steel framework erected it. The roof might also be of concrete anging inverted rolled steel tees on the oof principals, placed about 2 ft. 6 in. s, and between the tees placing pre-oncrete slabs 2½ in. in thickness, thus ating almost entirely the use of timber roof.

act, it was possible to do without timber ing expanded metal lathing to support aster. A roof of this kind was very sful for garages and fireproof buildings, ery speedy and economical in building. ys gone by it was the usual practice, erecting a concrete roof, to prepare an ate system of timber centering with a of timber underneath to support the e while it was wet; and for a period days or thereabouts, to give the concrete time to set, other tradesmen were hampered, and the progress of the very seriously delayed until the timber ng was removed.

and concrete was successfully used birnie, and the advantage of a roof of nd for fireproof construction must be ly clear to the thinking man. The might be jointed in bitumen instead of , which would give a certain amount ticity to the roof for expansion and tion, thus overcoming one of the great-ficulties of a roof made of solid con-which had no elasticity and would crack it would yield. The outer surface of of might then be treated with bitu-solution of various colours, or, if the were made of breeze, might even be with slates, tiles, or any other l to suit the amenity of the district in the house might be built. It might be t that this was an expensive system, was actually as cheap as any other.

in estates laid down definite rules as nature of the buildings to be erected ld the amenity of these areas, and this ten a great barrier to the progress of g, on account of the high cost if rk were demanded. In this connection ription of a system now being used to e this might be of interest. With stem pulverised stone, reduced to the of sand, from any desired quarry, red or white, could be applied in a state to the concrete blocks while they et, thus ensuring perfect cohesion of face treatment with the concrete back-he result of this method was that ad the appearance of the real stone, actually showed the silica, alumina, tering parts of mica, etc., and could nost stand a microscopic test for sand-With the use of this material, arches, s. etc., and indeed any type of work ould be done in stone, could be made t of 50 per cent. less than real stone.

merica perhaps one of the most inter-new methods of construction was that the walls were formed on the ground. n the flat, hinged at the base, and then raised to the perpendicular by means of winches. The expense and danger involved, however, did not justify the result. The late T. L. Watson, at one time a director of that College, improved on that system by forming the walls also on the horizontal, but hinged along the centre of gravity of the walls, and in that way deleted entirely the use of machinery.*

The underlying principle was the discarding of moulds or blocks in wall construction. The walls of the house were formed on horizontal platforms a few feet above the ground, and hinged as nearly as possible along the centre of gravity, so that when the concrete had set each wall was turned over on its hinges into the exact position. As the platform in its horizontal position balanced in the middle, due allowance being made for door and window openings, it followed that the lower half of the wall, in descending, automatically raised the upper half. No force was required and no apparatus employed (other than rope). The platform was adjusted to its vertical position before the concrete was applied, and the wall naturally assumed its destined place with accuracy.

The door and window frames were laid down on the platform before the concrete was filled in, so that the house was then ready for its roof and internal finishings. The platforms were formed of the roof spars and boarding, and the greater part of the material was, therefore, on the site and ready for use. The time taken to erect the four walls after the concrete had set was only one and a half hours.

Another patent system of some interest was one devised by Principal A. P. Laurie, of Heriot-Watt College, Edinburgh, in which breeze slabs are used for the inner part of the hollow wall in lieu of brick. The most interesting part of the system is the use of breeze bricks steeped in tar.

It was interesting to note that the mud hut of their prehistoric forefathers had blossomed into the pisé-de-terre dwelling of to-day. It was hardly creditable that a building made of mud could take its place with dignity amongst the modern perfectly equipped dwellings demanded by the present generation, but such was the case. Pisé-de-terre was dry earth thrown between shuttering, and rammed until consolidated. The shuttering used was 10 ft. long and 2 ft. 9 in. high, 9 in. of which, however, overlapped the completed course, so that 2 ft. was added to the wall at each operation. The same shuttering was then removed from the finished course and raised into position to take the next layer above. Red marl was the best soil for pisé building, but, with the exception of clay, almost any earth would do, providing it was free from vegetable matter. Clay and sand were unsuitable.

The next best earth to use was brick earth, or clay that had been well-weathered, broken up, and exposed to the wind and frost.

The humble dwelling of pisé-de-terre, or the modest concrete cottage, were commendable efforts to solve the problem of housing the poor, and many beautiful results had been obtained, but some people looked upon these with contumely.

The modest concrete cottage did not appeal to them, but it must be accepted that concrete for home building was particularly suitable for the low-cost house. For the structure which was built with hard-earned savings, and where economy must be practised, but where permanence, beauty and safety from fire were essential, concrete offered more for the money spent than any other material. The best type of plan for the concrete house was that which was the most simple and compact, and novel types would invariably be found more expensive than a straightforward arrangement.

There was another system whereby buildings

* Illustrated and described in *The Builder*.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-Masons' Labourers.	Plasterers' Labourers.
Aberdeen	1/7	1/8	1/7	1/8	1/7	1/7	1/4½	1/–	
Airdrie	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½	
Alexandria	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2	
Arbroath	1/7	1/6	1/6	1/7	1/6	1/6	1/5	1/1	
Ayr	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½	
Bathgate	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/1 to 1/2	
Blairgowrie	1/7	—	1/7	1/7	1/7	1/7	1/6½	—	
Bo'ness	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2

Stirlingshire (Eastern District)	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½	
Wishaw	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½	

* The information given in this table is copyright. The rates of wages in the various towns in England and Wales are given on page 782.

which gave one an impression of being in a ruinous and dilapidated state could now, at small cost, assume the massive rusticated appearance of the Palazzo Riccardi. For several years a builder in the north of Scotland had been performing these transformations in his native town. The whole secret lay in the use of cement panels, the average size of which was 16 in. by 8 in. by 1 in. in thickness. Their composition was two of sand to one of Portland cement. They were easily handled, easily packed for transport, and had stood the test of the rigorous climate of the north. The cost of this "clothing," whether for an old wall or for a new timber frame building, or for a completely fireproof steel-framed structure, was trifling indeed, and many an old building of comparatively little value to the proprietor, an eyesore to the community, might be greatly improved in appearance.

In summing up, he assured them that, whilst much thought had been given, perhaps too much, to patent systems of construction, yet, for the present at any rate, he had formed the impression that for domestic work the 12 in. hollow brick wall built in cement mortar was difficult to beat either for efficiency or economy. It would be a great pleasure to all there, he was sure, if they could return once more to the development of good Scottish masonry, where their craftsmen could have a chance to exhibit their skill, but, just as the written language of modern times had overpowered the native speech of older Scotland, the architecture of modern times had so overpowered the native style that one rarely saw any new work bearing traces of real Scottish feeling. The tide of education was advancing so rapidly that the people must respond to the new environment, and the new conditions resulting from the war had imposed on them the duty of erecting comfortable homes for the people at a price within the reach of all.

Chesham House, Regent Street.

Messrs. Thomas Faldo & Co., Ltd., of Windsor House, Kingsway, W.C.2, inform us that they have been appointed sub-contractors for the whole of the asphalte work involved in this building, which was illustrated in our last issue.

NEW BUILDINGS IN SCOTLAND.

Kirkcudbright.—ACADEMY.—It is proposed to reconstruct the Academy at Kirkcudbright at an estimated cost of £10,000.

Greenock.—CATTLE MARKET.—The Dean of Guild Court has granted the Greenock Harbour Trust permission to reconstruct the cattle auction mart in Laird-street. The mart was destroyed by fire some time ago.

Aberdeen.—HOUSES, &C.—The Corporation Plans Committee has passed plans as follows:—House at Hammersmith-road, for Mr. W. Grant; a house, Broomhill-avenue, for Mrs. Third; two houses at Ashley-gardens, for D. & J. R. M'Millan; two houses at Ashley-road, for James Philip and John Rodger; bungalow at Queen's-road, for Mr. John A. Cook, Ellon; bungalow, Anderson-drive, for Mr. James B. Gray; alterations to the hall of the Woodside Parish Church, and a meeting hall in St. Nicholas-street, for the East Parish Church. The Committee passed plans for the erection and alterations of buildings to the value of £6,550 in all.

Perth.—FACTORY.—The T.C. has been recommended to approve of plans for a new bacon factory near the harbour.

Irvine.—HOUSES.—The Board of Health has granted permission for the erection of 20 two-apartment houses under the new housing and slum area clearance scheme. A site for the proposed new houses has not been definitely fixed.

Lockerbie.—HOUSING.—The T.C. has forwarded plans of a new housing scheme to the Board of Health for their approval. The scheme has been prepared by Mr. David M'Jerrow, the Town Clerk.

Glasgow.—HOUSES.—The Housing Committee has promised the Board of Health that it will endeavour to erect, within the two years allowed by the Act, 5,000 houses, tenders for 2,400 of which are either already in the hands of the Committee or are being asked for. The Committee seeks authority to acquire part of the lands of Garscadden estate, adjoining the Bankhead-Knightswood housing scheme, and enable the main roads and main drainage to be carried out.

LAND FOR SCHOOL EXTENSION

MR. HOWARD MARTIN, Official Arbitra sitting at 5, Old Palace-yard, Westminster, he a claim by Mr. Simon Green against the Chisw Urban District Council concerning the Coun compulsory acquisition of a piece of la approximately 860 square yards, at the rea Nos. 342 to 348B (even), High-road, Chisw for the purpose of the extension of Belm Schools. Mr. S. A. Wilde (of Messrs. F brother, Ellis & Co., auctioneers and survey of Fleet-street, E.C.), giving evidence for claimant, submitted a valuation of £2,5 based on the assumption that School-road wo be continued, and that there would be o a nominal apportionment of rent under existing lease. Mr. G. S. Wain, District Va for West Middlesex, on behalf of the Ur Council, detailed a valuation of £900.

The award is as follows: "That the acquir authority is to pay the claimant the sum £1,446 as compensation, it being agreed that rent reserved under the existing lease is no be apportioned, and that the acquiring autho is to extend the School-road across the lan be acquired so as to give the remaining l of the claimant a frontage to the south sid the extension, the extension to be made maintained at the expense of the acqui authority, and I order the acquiring autho to pay the stamp duty and contribute £31 towards the costs of the claimant."

Municipal Elections.

Alderman J. Cook Rees, in 1917 Presider South Wales Institute of Architects, has b appointed Mayor of Neath.

Newport (Mon.) Borough Council has pointed Mr. Charles F. Williams, retired buil Mayor for the ensuing twelve months.

Councillor Evan Hopkins (Messrs. J Hopkins & Son, builders) has been ele Mayor of Cowbridge.

The re-elected Mayor of Monmouth is C cillor A. H. Williams, builder and contract

Reinforced Concrete Bridge at Kinlochleven, Argyllshire.

[Total length, 180 ft. Span of arch, 100 ft. Designed by MESSRS. MOUCHEL & PARTNERS.]

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk re advertised in this number. Certain conditions beyond those given in the following information re imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any ender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and hat deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names f those willing to submit tenders, may be sent in; the name and address at the end is the person from whom r place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

NOVEMBER 17.—**Aberavon.**—EXTENSIONS.—For extensions to the Elim C.M. Hall, Velindre, Aberavon, r the trustees. The proposed new wing measures out 45 ft. by 26 ft., with vestries, &c., in addition. essrs. Thomas & Morgan & Partners, . rchitects, . Gelliwasted-road, Pontypridd.

NOVEMBER 17.—**Ayr.**—BUILDINGS.—For buildings be erected at Springvale-place, Saltcoats, for the ights and Measures Dept. of the County of Ayr. r. Hugh Thomson, architect, 60, Hamilton-street, lrcoats. Deposit £1.

NOVEMBER 17.—**Cwmtaff (Breconshire).**—HOUSES.—r erection of a pair of semi-detached houses at rmtaff (Breconshire) for the Cardiff Waterworks mmittee. Mr. C. H. Priestley, M.Inst.C.E., City ll, Cardiff. Deposit £2 2s.

NOVEMBER 17.—**Ebbw Vale.**—PAINTING.—For painting the interior and exterior of the Ebbw Vale Council blic offices. District wage conditions. Mr. P. I. vies, Surveyor, Council Offices, Ebbw Vale.

NOVEMBER 17.—**Edinburgh.**—LAVATORY.—Erection a public lavatory for women at Tollcross, for the T.C. . A. Horsburgh Campbell, Burgh Engineer, 329, High-eet, Edinburgh.

NOVEMBER 17.—**Felling.**—HOUSES.—Erection of 24 uses (which may be increased to 50), for the U.D.C. . C. W. Hall, Architect, Council Buildings, Felling.

THE WEEK IN PARLIAMENT.

WESTMINSTER, *Wednesday.*

PARLIAMENT reassembled for the Autumn Session on Tuesday, November 13th.

Houses Sanctioned and Completed.

Sir Kingsley Wood asked the Minister of Health for the number of houses respectively sanctioned, built, and in course of erection under The Housing, &c., Act, 1923.

Sir W. Joynson-Hicks said that 57,830 houses were provided for in schemes approved under The Housing, &c., Act, 1923, so far as returns had been furnished by local authorities, 1,849 houses had been completed ready for occupation and 10,854 were in course of erection on the 1st instant.

Answering a further question, Sir Wm. Joynson-Hicks said that by November 1, 10,854 houses had been commenced and 1,849 houses completed under The Housing, &c., Act, 1923. In addition 1,366 houses were commenced and 2,523 houses completed since August 1 last in connection with uncompleted schemes under The Housing, Town-Planning, &c., Act, 1919. Statistics were not available as to the number of working class houses erected without State assistance during the period, but from returns which he had recently obtained approximately 20,000 new houses of a rateable value not exceeding £26 had been completed during the six months ending September 30 last and over 22,000 containing five rooms or less were in course of construction at that date.

Schemes Sanctioned.

Sir W. Joynson-Hicks informed Sir Walter de Frece that schemes had been approved under The Housing, &c., Act, 1923, providing for the erection of 26,705 houses by local authorities, 3,040 houses by societies, trustees and companies acting under Section 3 of the Act, and 28,085 houses by other forms of private enterprise. Those schemes covered practically the whole country and embrace the areas of nearly 600 local authorities.

Lt.-Col. Guinness said that on November 5, 1923, which was the latest date at which the information was available, 727,331 notices of appeal against the new assessments of property to Income Tax, Schedule A, had been entered. Of this number 620,600 had been disposed of, leaving 106,731 still to be dealt with.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDARE.—Agreement has been reached between the Aberdare and Mountain Ash U.D.C. for joint purchase of the old Aberdare Canal at approximate cost of £2,400. It is proposed to complete works estimated to cost £42,000, as follows, in the canal bed; improvement, Mountain Ash and Abercynon main road, and construction of new road on canal side Abercynon lock to Town Hall, Mountain Ash; improvement of road, Cwmbach to Mountain Ash. Formal notice of acquirement intention has been given by parties concerned.

BEWDLEY.—Bungalow, for Mr. Clement Bell.

BRECONSHIRE.—The Ministry of Health is to examine ground of proposed new Trefeeca sewer scheme by Hay R.D.C.——Sanction to expenditure by Hay Council of £4,000 on new cattle market has been received subject to site being suitable.——The Brecon (Town) Public Works Committee has passed plans as follows: New sports pavilion for Christ College, Brecon; new theatre for Messrs. R. W. Phillips & Sons. The T.C. has applied for sanction to borrow £7,000 for new high-level water works, stipulating all material used to be British made.

BRENTWOOD.—Plan passed by U.D.C.: Shop, Crown-street, for Larkin & Sons.

BRIGHTON.—Plans passed by T.C.: Conversion into flats, 38, Montpelier-crescent, for Executors of E. J. Reeves; four houses, Hollingbury-road, for W. J. Burstow.

BRISLINGTON.—The Sutton Trustees propose to erect 193 houses in Brislington, all of which are to rank as subsidy houses.

BROMLEY—Plans passed by R.D.C.: Mr. J. Lewis, two detached bungalows, Aperfield-road, Biggin-hill; Mr. E. P. Fitch, two detached bungalows, Aperfield-road, Biggin-hill; Mr. W. F. Miles, detached bungalow, Sutherland-avenue, Biggin-hill; Mr. L. Fosbrooke, garage at Ashlands, Cudham-lane; Mr. H. Lynch-Watson, bungalow, Longdon Wood-avenue, Keston; Mr. E. E. Morris, bungalow at Main-road, Leeson's-hill, St. Paul's Cray; Mr. C. P. Pooley, bungalow, Honeyden-road, North Cray.

CARDIGANSHIRE.—The County Council has decided to make grant towards erection of three bridges at Rhyd, Trebedw, and Henllan by the Llandyssul Council. The Cardigan R.D.C. has applied for grant towards reconstruction of Llechryd-Aberporth road; estimate £7,300.

CALLINGTON (CORNWALL).—The U.D.C. has decided to lay down two hard courts for tennis and a bowling green in Saltash-road recreation field, at an estimated cost of £475

CHISLEHURST.—Mr. T. R. Ferens has given another £10,000 so that the extension to the Farrington Girls' School may be carried out.

DALTON.—Plans passed by U.D.C.: Bungalow at Ireleth, for Mr. H. T. Davidson; new shippon and alterations at Sandside Farm; new shippon and alteration at Billincoat Farm.

DARLINGTON.—The Streets Committee has approved plans for 200 houses, with respect to which the subsidy will be applied for. Sixteen are for the Darlington Co-operative Society.

DEVON.—The C.C. Public Health and Housing Committee is appealing to the Ministry of Health to be allowed to complete the children's pavilion at the Hawkmoor Institution for tuberculous patients.—— The Committee has decided to acquire a site of not less than four acres within reasonable distance of Exeter upon which to erect a hospital.

DUMBARTON.—At Dean of Guild Court plans were passed for an additional 40 houses to be built at Silverton, forming the fourth development of the municipal housing scheme. Mr. W. A. Macartney, the burgh engineer, stated that the cost of the house would be about £400 for the three-apartment variety, and about £475 for the four-apartment variety.

EAST COWES.—Plans for a pair of houses in Oakfield-road, for Messrs. Brading & Son, and a house in York-avenue, for Mr. J. Nayler, have been approved by the U.D.C.

EAST LOTHIAN.—The East Lothian Water Board has decided to put in hand two water extension works, with a view to relieving unemployment and securing an adequate supply to the colliery districts. One scheme, estimated to cost £54,291, involves the laying of a 12 in. main from the Hopes Valley to a service reservoir to be constructed near Haddington. The other, estimated to cost £30,625, provides for the laying of a new trunk main, together with radiating mains, to the existing system.

FALMOUTH.—Mr. P. M. Crosthwaite and Dr. W. V. Shaw, Inspectors of the Ministry of Health, have held an inquiry into the application of the T.C. for sanction to borrow £80,000 for a sewerage scheme.

FLINTSHIRE.—Mr. H. N. Gladstone, of Hawarden Castle, Lord Lieutenant of Flintshire, has offered the Flintshire County Council £7,000 towards establishing a maternity home for Flintshire, subject to the institution being called the "Catherine Gladstone Memorial Home."

GILLINGHAM.—Plans passed by T.C.: Lock-up shop, Woodside, Wigmore, by Mr. E. J. Hammond, for Mr. F. Knight; shop, with dwelling, junction of Barnsole-road with Park-avenue, by Mr. Marshall Harvey, for Mr. Miller; 120 houses, Larkfield and Alexandra-avenues, by Mr. A. W. Little; shop and dwelling, Woodside, Wigmore, by Mr. E. J. Hammond, for Mr. F. Knight; lock-up shop, Gad's-hill, by Mr. Davenport, for Mr. A. Hart; bungalow, Wigmore-road, by Mr. E. J. Hammond, for Mr. F. Parham; bungalow, Barnsole-road, by Mr. E. J. Hammond, for Mr. G. C. Swain.

GLAMORGAN.—The Glamorgan County Council is to proceed with following works: New school and additions at Tymeinwr to accommodate 550 children; new school at Larleston for 150 children; additions to schools at Kenfig-hill for 50 additional scholars; additions to school at Plasnewydd, Maesteg, for 277 children and additions to Derwen Deg Schools, Gellygaer, for 100 children. The Gower R.D.C. is to borrow £6,470 to carry out Penclawdd-Llanrhidian road improvement.

GLASGOW.—The Dean of Guild Court have passed the following: Double cottages on the south-west side of St. Bride's-road, Newlands, for Mrs. Baird and Mrs. Samson; six semi-detached villas in Courthill-avenue, Cathcart, for Messrs. Andrew Aitken & Co.; alterations and additions to the works of Messrs. Alexander Ferguson & Co., Ruchill-street, Maryhill; alterations and additions to the works of Messrs. Schweppes, Ltd., Killean-street, Possilpark; extensions to works for Messrs. Fred Braby & Co., Darnick-street, Springburn; additions to the factory of Lang's Bread Co., in Wesleyan-street; a house to be erected at Belvedere Hospital, by the Health Department of the Glasgow Corporation; double bungalow in Springburn-road, for James Hodgnes; and a verandah at Cowcaddens, Kintergarten, for Health Department of the Glasgow Corporation.

HASTINGS:—Plans passed by T.C.: Pair semi-detached houses, Victoria-avenue, Mr. W. J. Emerton, owner; alterations to London Joint City and Midland Bank, 4, Robertson-street, London Joint City & Midland Bank, owners, Whinney, Son & Austen Hall, architects; workshops, Gas Co.'s yard, Queen's-road, Mr. J. Simonds, owner; conversion of 60, High-street, into shops, Mr. W. Pollard, owner, Messrs. Callow & Callow, architects; shop, Bexhill-road, Mr. W. Pulman, owner; house, Filsham-road, Mr. F. Mumford, owner; two semi-detached houses, Beaufort-road, Mr. J. E. Jerham, owner, Mr. J. Hunt, architect; detached house, Collier-road, Miss E. M. Newman, owner, Mr. H. W. Coussens, architect.

HAY.—The Ministry of Health has assented to the U.D.C. borrowing £2,750 for water works improvements

HAYES.—Plans have been approved by the U.D.C. for two houses in Cromwell-road, for Mr. W. Brooks; extensions to the factory of Messrs. Harrison & Sons, and for 50 houses for the G.W.R. Garden Village Society.

HEBDEN BRIDGE.—A scheme has been launched for the erection of a new Trades Club, and the nucleus of a building fund has been formed by a loan of £3,000 from the local trade unions. An early start is to be made.

HECKMONDWIKE.—Plans passed: Alterations and additions in Beck-lane, for Messrs. Hy. Cockhill & Sons, Ltd.; two houses at Nunroyd, for Mr. W. Rhodes.

HORSFORTH.—Plans passed: Two houses in Victoria-crescent, for Messrs. Road Bros., and four houses in Victoria-walk, for Mr. J. B. Lees.

LONDON.—A fire has occurred at Lever House, Thames Embankment, involving considerable damage.

NEWPORT (MON).—A fire has done damage running into thousands of pounds to the premises of (*a*) Messrs. Crosta's brush factory; (*b*) Messrs. Reynolds & Co.'s upholstery establishment: and (*c*) Messrs. Evans & Sons' heating and sanitary engineers' works, all of which were gutted.

ROCHDALE.—Dixon's Soap Works have been completely destroyed by a fire.

External Treatment of Concrete.

Arrangements have been made for Mr. Frederic Coleman to repeat the lecture he gave in September at the West End Cinema, on "External Textural Finishes in Concrete" and "The Application of Cast Concrete Stone to Present-day Building" (illustrated by a film showing the practical application of white cement stucco, and lantern slides showing American architecture). The dates are: Edinburgh, November 20; Glasgow, November 21; Birmingham, November 27. In Edinburgh the lecture will be given at the Gartshore Hall, 116, George-street, at 5 p.m.; in Glasgow, at 11 a.m., at Cranston's Picture House, Renfield-street. Tickets for the Edinburgh and Glasgow lectures may be obtained from Messrs. Sutherland, Matheson & Reid, 50, Wellington-street, Glasgow. The lecture in Birmingham will be held at the Regent Picture House, New-street, at 11.30 a.m. Tickets may be had on application to Messrs. Goodman & Co., Salford Bridge Wharf, Gravelly-hill, Birmingham. All interested are invited to attend.

Carillon of Bells, New York.

The carillon which Mr. John D. Rockefeller, Jun., is installing in the beautiful Gothic tower of Park-avenue Church, New York, in memory of his mother, is to be increased in size and number of bells. Some of the best brains in the architectural and engineering world of America have been engaged for some months in devising better accommodation for the bells than that which had been possible so far.

The bells will be 53 in number. The bass bell is to weigh 9 tons, whilst the total weight of the bells—apart from the gigantic framework (which will be in five sections) and the fittings—is to be over 50 tons. The premier carillon hitherto has been the famous one at Malines, where there are 45 bells, and the bass bell weighs 7½ tons.

Many of the bells for the new carillon are already cast and in readiness at the Croydon Bell Foundry of Messrs. Gillett & Johnston, who secured the contract in the face of keen international competition.

TRADE NEWS.

An attractive page catalogue illustrating some of the many types of their folding and sliding doors, &c., is issued by the Richards-Wilcox Canadian Co., Ltd., of London, Ontario, Canada. The representatives of the firm in the United Kingdom are E. Hill Aldam & Co., Ltd., of 93, Stamford-street, S.E.1. The complete catalogue of 160 pages will be forwarded on request.

Manufacturers and others will find a perusal of the "What We Make" booklet issued by Tangyes, Ltd., of Cornwall Works, Birmingham, interesting and profitable. The various types of this firm's oil, gas and steam engines, pumping plant, lathes, and other products are illustrated and described in a neat and attractive manner.

Messrs. James Clark & Sons, Ltd., of the Blackfriars Glass Works, S.E.1, are to be congratulated on the noteworthy achievement in regard to the glazing work at Peter Robinson's shop front at Oxford-street, W., where they fitted the largest squares of polished plate glass ever supplied in this country. Each of the four largest squares measures approximately 291 in. by 120 in., a total superficial area of 242 ft. 6 in. in each square. These are records for size and areas in this country, and the work was done by Messrs. Clark's own staff to the order of Messrs. Samuel Haskins & Bros., Ltd., who supplied the entire bronze metal work for the shop fronts, entrance doors, grilles and marginses.

The main traffic between Ormesby, South Bank, Guisborough, and Middlesbrough concentrates in North Ormesby at Langbaurgh-place, and the road is being relaid under the direction of the Ministry of Transport. A concrete foundation, 7 to 8 in. thickness, is being laid on an excavated formation, and the concrete layer is reinforced by "Maxweld" fabric—a special steel interlocked double layer reinforcement supplied by Messrs. Richard Hill & Co., Ltd., reinforced concrete engineers, of Middlesbrough and London.

PATENTS.*

APPLICATIONS PUBLISHED.

181,713.—G. M. Gouyaud: Method of constructing reinforced concrete arches without using moulding, arched falseworks, or scaffoldings.

187,611.—H. H. Warmund: Composition of matter suitable for producing coatings, seals, or the like.

187,945.—R. S. K. Banerjee: Waste-preventing taps or valves.

189,134.—O. Lenart: Apparatus for grinding paint.

194,283.—Foraky Soc. Anon. Belge d'Entreprise de Forage et de Foncage and L. L. B. Denis: Apparatus for measuring the deviation of borings.

194,655.—R. M. Maunder: Lock.

199,725.—L. Courtot: Radiators for heating buildings.

200,543.—H. M. Cooper and H. B. Willmott: Lifting and dumping or ring discharge grab.

200,549.—W. Barraclough and W. T. Barraclough: Domestic fireplaces.

200,561.—A. Lynn: Method of forming ceilings in halls and other buildings.

200,564.—F. Hartgrove: Concrete block waterproof dressing.

200,569.—W. Wilkinson: Packing-cases and the like.

200,571.—H. R. Sankey: Fire-resisting doors and screens.

200,576.—H. J. Lee: Locks for doors.

200,632.—W. H. Brecknell: Door locks.

200,636.—J. E. C. De Wijs: Apparatus for directing circular saws for grinding on rotary stones.

200,674.—R. Simms: Ventilating cowls for poultry houses and other structures requiring ventilation.

200,693.—A. W. Topp: Production of lead compounds and the manufacture of paints and anti-corrosive compounds therefrom.

200,695.—Parker, Winder & Achurch, Ltd., and J. A. Wood: Operating-devices for fanlights or other pivoted windows or flaps.

200,697.—C. Dickie: Steam-heating installation.

200,703.—British Fibrocement Works, Ltd., and G. H. Buxton: Roofing sheets, tiles, and the like.

200,721.—F. L. Keppler: Manufacture of building and paving tiles and slabs.

200,726.—R. Newton: Cement or adhesive composition.

200,728.—F. Morton: Floors.

202,423.—G. W. Lancaster: Window structure and plurality of closures therefor.

202,465.—L. D. Vaney: Method of securing locks.

202,676.—G. H. Pledge: Showcase fittings.

202,698.—O. Frosell: Hard-setting magnesia compositions.

202,706.—Star Metal Stamping Co., Ltd., and C. W. Harris: Baths.

202,737.—T. Gare, sen.: Manufacture of bricks, blocks, slabs, and tiles.

202,742.—P. C. Cannon and Centrifugal Concrete Blocks and Poles, Ltd.: Manufacture of concrete products.

202,788.—A. E. White (American Arch Co.): Construction of brick arches for furnaces.

202,791.—J. Ridgway and W. Ridgway & Sons, Ltd.: Wood-boring tools.

202,799.—S. T. Harrison and A. C. Harrison: Machines for sifting potters' slip.

202,831.—W. Marshall and C. Downs: Machinery or apparatus for compressing and moulding meal and other soft or plastic materials.

202,850.—W. Story: Glazing of roofs.

202,856.—S. W. Mobbs: Groynes or walls for coast protection.

* **All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.**

NEW COMPANIES.

THE particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 & 117, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

KIDDERMINSTER HOUSE BUILDERS, LTD. (193,081). Registered October 15. 11, High-street, Kidderminster. Contractors, builders, civil constructional, mechanical, electrical and general engineers, &c. Nominal capital, £1,000.

C. PEPPIATT (WORTHING), LTD. (193,097). Registered October 16. The Estate Office, Lynton-road, Springfield Park, Acton, W. Builders and contractors, &c. Nominal capital, £3,000.

HEW BRICK WORKS, LTD. (193,181). Registered October 18. 125, Mason's-hill, Bromley, Kent. Bricks, tiles, pipes, &c. Nominal capital, £1,000.

PENNANT STONE QUARRIES, LTD. (193,165). Registered October 18. Quarry owner, lime burner, stone and lime merchant, contractor, farmer and blacksmith, now carried on by Thomas Rhys Williams at Nine Mile Point and Cross Keys, Monmouth, under the style of Evans Bros. Nominal capital, £10,000.

S. R. HENSHAW & SON, LTD. (193,178). Registered October 18. 14, Colquitt-street, Liverpool. Plumbers, painters, decorators, builders and contractors, formerly carried on at 14, Colquitt-street and 57–59, Seel-street, both in Liverpool, under the style of S. R. Henshaw & Son. Nominal capital, £4,000.

EUGENE C. TOMKINS, LTD. (193,194). Registered October 19. Zetland Buildings, Middlesbrough, Yorks. Quarry proprietor and iron and steel merchant, now carried on by Eugene Carter Tomkins, at Middlesbrough, Yorks, under the style of Eugene C. Tomkins. Nominal capital, £6,000.

A. SPENCER, LTD. (193,179). Registered October 18. 208, High-street, Merton, S.W.19. Builders' merchants, timber merchants, &c. Nominal capital, £100.

COMMERCIAL STRUCTURES, LTD. (193,221). Registered October 20. Builders and contractors, &c. Nominal capital, £1,000.

POWELL & RAYBOULD, LTD. (193,207) Registered October 19. Builders and contractors, carriers, &c. Nominal capital, £1,000.

HOOD & CO. (BUILDERS), LTD. (192,807). Registered October 1. Rosemary, Grosvenor-road, Southampton. Builders and contractors, &c. Nominal capital, £500.

RICHMOND LAND DEVELOPMENT CO., LTD. (192,953). Registered October 8. 7, Hill-street, Richmond, Surrey. Property dealers, builders, contractors, &c. Nominal capital, £25,000.

ELLIS, PARTRIDGE & CO. (LONDON), LTD. (192,898). Registered October 5. Gordon House-road, Kentish Town, London. Slate and timber merchants, slating and tiling contractors and brick manufacturers, heretofore carried on by Ellis, Partridge & Co., Ltd., at Gospel Oak, and Leyton, London. Nominal capital, £10,000.

ISAAC DIXON & CO., LTD. (193,024). Registered October 11. Constructional engineers, iron, steel, and timber roof and building manufacturers, &c. Nominal capital, £4,000.

J. U. JONES, LTD. (192,808). Registered October 1. Builder and contractor, now carried on by James Urban Jones at Edgwick-road, Foleshill, Coventry. Nominal capital, £2,000.

EARLSFIELD CONSTRUCTION CO., LTD. (192,897). Registered October 5. 70, Victoria-street, Westminster, S.W.1. Contractors, sanitary builders, constructional engineers, &c. Nominal capital, £1,000.

HOLLINWORTH & SON, LTD. (192,979). Registered October 9. Builder and contractor, now carried on by John Hollinworth at Miller-street, Worsley-road, Patricroft, Lancaster, under the style of J. T. Hollinworth & Son. Nominal capital, £15,000.

National Association of Builders' Labourers.

A private conference of the National Association of Builders' Labourers, attended by over 100 delegates, was held at Middlesbrough recently, at which it was announced that after considerable delay,, the Association would from January next be merged, with other bodies connected with the trade, into the Builders' Labourers' and Constructional Workers' Society.

At a dinner which followed, Mr. J. W. Welsh, of Middlesbrough, general secretary of the existing organisation, said they had endeavoured with much success to lift the builders' labourers to a higher plane, and he trusted the amalgamation would be an inspiration for unity. The chair was occupied by Mr. J. Cavanagh (President of the Association), who said it would not be long before there would be one union for all engaged in the building industry.

"Punch's" Almanack for 1924.

The receipt of *Mr. Punch's Almanack* (price 1s.) reminds us somewhat suddenly that the festive season is upon us, and we welcome it. The issue is full of good things, including many pages of coloured illustrations.

Astley-Ainslie Institution.

Canaan Park House, the first unit of the Astley-Ainslie Institution for the reception of convalescent patients from Edinburgh Royal Infirmary, an important scheme for which there is now available about £600,000, was formally opened on Saturday afternoon. The scheme is the outcome of the beneficence of Mr. David Ainslie, of Costerton, Midlothian, who died in 1900, and who directed that the residue of his large estate should accumulate for fifteen years for the purpose. The conditions of the will specified that the buildings should be of stone, and that they should follow the design of Watson's Hospital at Belford Bridge, and Mr. John Jerdan, F.R.I.B.A., to whom the architectural work has been entrusted, has practically reconstructed the original property. The building, which consists of two stories, has accommodation for 34 patients, 14 indoors in each ward and three on each of the open-air verandahs, which are a feature of the wards.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXV.—No. 4216. NOVEMBER 23, 1923.

"HOW TO PROVIDE HOUSES."

HE Independent Labour Party has issued a manifesto defining the steps that a Socialist Government would take to solve the problem of the erection of the working-class house. While we are in entire agreement with the statements illustrating the disastrous ue to bad housing, we cannot accept the basic assertion he present housing shortage is the most glaring example ilure of profit-making capitalist society to supply the the nation," made as if such a statement embodied ident truth. If we are to examine what "capitalist was able to do in housing the people, we must go the years prior to 1910, when we find conditions very from what they are now. Then a sufficient number of ere built to accommodate the population without any g made upon the public purse. We admit that the ere not as a rule what they should have been, but we ttribute the poor standard generally adopted to the ence of a "capitalist" system. A more conscientious, , and idealistic society, still working on "capitalist" d within economic limits, might in pre-war days have really excellent results, and in certain cases such ually obtained. Capitalism misapplied is as harmful as r misapplied system.

ther paragraph informs us as an interesting fact that houses are required, and 85,000 unemployed builders nted from building them." Some of our friends would h this and say that the trade unions are doing the g, but as the Independent Labour Party can hardly t, we should like to know who is doing the preventing. or information.

ialist Government, we are told, would prohibit all " building until the housing needs of the people . It is precisely this kind of wild legislation which is dreaded in such a Government. In the manifesto it is as "intolerable that wealth should be spent and ployed in erecting places of pleasure and emporiums e of the wealthy, while the children are being destroyed ealth of the people undermined by bad housing con-

Suppose a Socialist Government, in pursuance of ved policy, stopped all work on large emporiums, happen to those engaged on steel construction, stone nd marble work; to the sculptor; to the man who lifts, and the hundred other elaborate fittings associ- these large stores? Are all these highly-skilled and workers to be set to build houses out of clinker blocks? , we must confess that a proposal to cause a monstrous nemployment in such skilled trades for the sake of cal objection to luxury is absurd. We readily admit flaunting of luxury, especially at the present time, ble, and we also consider that the ever-increasing sness of the large store is inimical to good architecture; ot a case for legislation.

mpting enough to say that "if national effort can be for the purpose of war, it can be organised for the constructive peace"; but to argue thus is to overlook at the national war effort was a frightfully wasteful , quite apart from the waste inherent in war itself. fforts cost millions of pounds more than they need, in sending up the cost of living, a process that cannot ndefinitely if national bankruptcy is to be avoided. The Addison scheme was an effort at national housing, and as an initial impetus and in setting a high standard it was of great value, but its ever-expanding cost must surely have indicated, even to the most sanguine idealist, that such a scheme could offer no permanent solution to the housing problem.

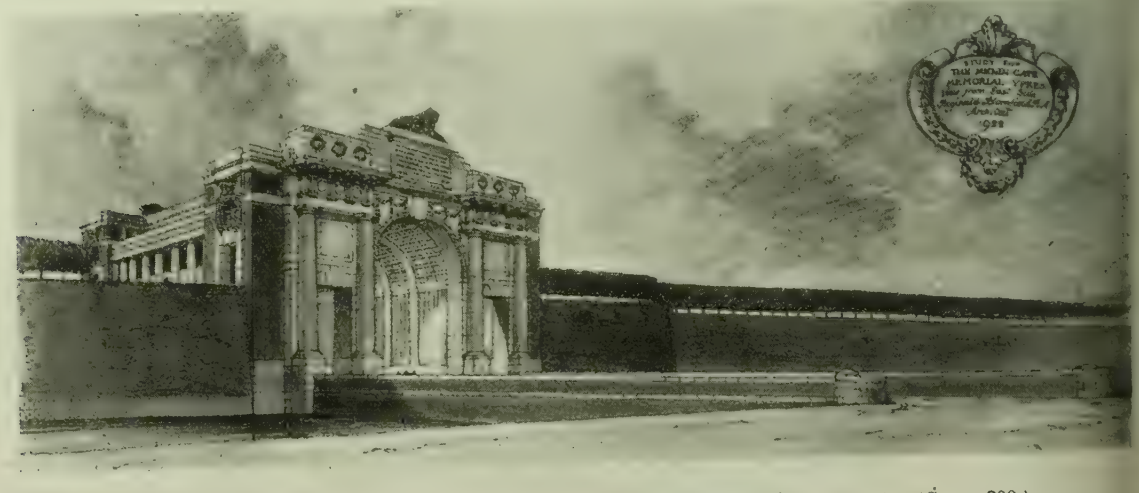
It is highly unfortunate that so many who are keenly concerned with this question should nail their flag to one particular mast-head and refuse to co-operate in any proposal but their own, and if their own happens to be unpopular with the bulk of their neighbours they sit down and refuse their help. The end is surely more important than the means, and one would have thought that quite enough good and satisfactory work had been done in pre-war schemes (too well known to need mention here) to demonstrate that private enterprise—or call it capitalism—is capable, when properly directed, of justifying the faith of the most exacting. At least the present Government is pledged to give it every chance of making good, and, whatever political destiny may be in store, we suggest that it is the duty of everyone who wishes to see the housing question solved to give the present system every chance. If by circumstances it should be changed for another system, we should advocate the same co-operation from those who might be politically opposed. It is easy to show how few houses for the working classes have been built during the past year and it is equally easy to talk about the Government building 200,000 per annum With the whole resources of the State behind it, working at full pressure, at a cost of nearly two hundred million pounds, it took the Government over four years to build 176,000 houses. In face of these figures, who would be bold enough to calculate the cost to the State of a Government scheme that involved building steadily at the rate of 200,000 a year? The expense of such a scheme would be so prodigious that we should soon be involved in an endless upward scramble between the cost of living and the rate of wages. Neither must we forget the inevitable inefficiency of Government control in the output of materials. The National Projectile Factories were marvellous institutions and the Ministry of Munitions an unparalleled creation; but its methods were about the only fountain that kept humour alive during the war. To create such a monster to build workmen's houses would be like erecting a steam hammer to flatten domestic flies. When the steam hammer gets the fly into position it is certainly deadly, but private enterprise—in the form of small fly-papers scattered here and there—is much cheaper, and much more efficient. Finally, our hope lies in promoting an increasing sense of responsibility rather than in any artificial prohibition of luxury, or in the regulation of prices by fantastic legislation.

Let the Independent Labour Party keep alive the insistent cry for action and reform, but let it show some faith in the public conscience and at least give it a chance to show that these problems can be solved in anatural and healthy way. Such a course of propaganda need not be at variance with any political programme, but it would allow the party to co-operate with all citizens of good will, and to work to the same end. A man or an organisation that will not help a social scheme projected by a political opponent for fear that his help may make the scheme a success may score a political point, but he is failing in citizenship, and this is remembered against him to the detriment of his own schemes when he gets the chance of testing them.

NOTES.

The Sale of City Churches.

It is satisfactory to know that this matter is to receive further consideration, for it is evidently difficult for the Bishop of London to realise the strong objections felt by great numbers of people to the disposal of the City churches. Representative societies, no less than individuals, are almost unanimous in their objections to such vandalism, and if persisted in the effect on the public mind will be very harmful to the Church's influence. For there is a growing sense that there is not sufficient appreciation by those who countenance such a step of the importance of good architecture, nor for what it stands, and in destroying this witness of the past they are undoing with one hand what they hope to do with the other. For these historical, sacred buildings are witness also of the aspirations and beliefs out of which they grew, and those who find no importance in this view and would destroy them are effecting a loss to religion itself. What advantage can there exist in such a case, when we only destroy in one place in order to provide in another? The money gained by the sale of these churches is loss if it injures the very cause for which it is to be used elsewhere. Moreover, the reasons for their destruction seem to us open to a different interpretation. In a letter from the Rev. R. J. Campbell to the *Times*, he says, "Unfortunately, the policy of ecclesiastical authority has too frequently been that of rewarding men for good service elsewhere by putting them into City livings, to whose peculiar conditions they are not suited." If this policy were discontinued and men with preaching gifts and a true vocation of service, and conscious of the extent of the need of their work, were now to be appointed, we doubt not that these churches would be filled, and that there would be no problem of the City churches to solve.



King's College Chambers, Cambridge.

As supplementary to our review of the Cambridge Competition designs for King's College new Library and sets of Chambers on the 9th inst. (when we illustrated the winning design), it will be interesting to mention a few facts about the intermittent endeavours which have from time to time been made during the past 200 years to carry out these desirable and much-needed additions. The present project is the third attempted occasion for the erection of a new Library for King's. James Gibbs originally planned it to form the rear façade of a secondary quadrangle towards Trumpington-street. He placed his Library at right angles with the Senate House. This latter cost £13,000, and was opened in 1780, but it still remains an isolated fragment of Gibbs' big collegiate scheme. On the south end of his Library he proposed to repeat the skyline of the Senate House by building a Consistory and Registry set in a line with the north side of the splendid Chapel of which Henry VI laid the foundation stone in 1446. Gibbs also included in his plan an imposing central frontispiece next Trumpington-street on the site of the present lodge and screen designed by W. Wilkins, and built in 1824. That palatial pile was to correspond with "the Gibbs' building" now gracing King's "great lawn." This capacious quadrangle southward of the chapel was to terminate with a range of offices and lodge for the Provost, which would have stood next the site chosen for the present competition design for the new Library and sets of chambers which will extend in front of "Mulberry Tree-court," "The Provost's Garden," and "the Bodley Quadrangle," overlooking the "Backs" and River Cam where King's bridge stands. The late G. F. Bodley, R.A., erected the Provost Lodge and last-named buildings in 1894. Those in front, which are to be forthwith demolished to clear a site for the present extensions, were carried out just a century ago by William Wilkins, R.A., whose design was s against those of eighteen comp The College authorities compelle however, to accept various sugg from three other architects—, Wyatt and Nash—and Crosby H given as a model to emulate. The quality of this coalition scheme is evident; its demolition need c regrets.

Robert Adam's King's College Library.

Robert Adam's ha enterprise for the of a new Library for College* was plan tween 1784 and 178 scheme differed essentially in det general form from Gibbs' proposal was broader in style and plainer i but Adam adopted the same posi the Library by placing it contiguo the Senate House—indeed, he that structure as an eastern flanki to his square-shaped Library, on t wing of which he repeated Gibbs' House, extending the compositi laid out towards Clare College, in to build on the intervening site sti pied by the "Public Schools." scheme likewise included an inde block similarly located as in Gib out, south of the new great qua but besides providing a lodge Provost at its western extremity included a clever and unique College Hall in the middle southern range, which also several sets of scholars' rooms, tern at the frontage line in Trump street. Nothing came of these posals, so characteristic of Robert who also showed many chang doubtful elaborations of the P work built by robustious Gibbs. nately his "Fellows' Building" quently escaped mutilation at t of Wilkins, who contemplated

nsur- and hes. It is satisfactory to know that the articles on "The Incidence of Insurance," contributed by our special ondent in *The Builder* for October 12, are being appreciated. Their l application is confirmed by a nication to hand this week from g metropolitan insurance company the matter up; the company also he comparative lists of current eriodically issued in our pages very o the point. A vast number of s insured prior to 1914 possess based upon the average costs of g during the early part of this . Old yearly-published price upply statistics of such variations. glad to learn that an endeavour is hade towards improving the con- of insurance for churches and we ed to advise as to solving this problem. Ecclesiastical property are blamed for under-insuring uildings, but it is only fair to e that the contention embodied Report of the Houses of Laymen vocation," issued in 1913, deserves ention than appears to have been from the insurance companies. ission of the "Average Clause" ich policies was therein asserted tial, and up to now this claim has eated by the companies as an nted demand. Churches vary ructurally and in location, some the open, others on crowded ach church, too, differs greatly n parts so that the same risk and nnot be justly averaged save by pre-arranged appropriation. We suggest that screens, pulpits, stalls and other fittings as well as the contents, such as vessels, vestments, pictures, and the like, ought to be scheduled and provisionally priced at agreed values with proportionate premiums, reckoning the fabric at a far less valuation subject to specific exceptions, such as each case may demand. Insurance risks can only be covered by actuarial calculations, but on the other hand church councils are not financially positioned for heavy insurances. Some such scheme thus outlined would, in the majority of cases, enable them adequately to meet fire risks and at the same time justify insurance enterprise by fixing it on a more mutual basis.

British Museum Lectures. In the most recent of her lectures at the British Museum, Miss Claire Gaudet in describing the methods of building, told us that the Egyptians built from the outside inwards as the best way of keeping out the sun; and of the effects of climate on the form of building, as in the flat roof in the East, which is also used as a sleeping place. For the building of the Pyramids, the labourers floated the granite down from the quarries on rafts and then dragged it on rollers up the great causeway leading to the Great Pyramid, of which traces still exist. The view that the Pyramids were built entirely by slave labour is regarded as incorrect. Each year for three months most of the cultivated area was flooded, at which period the agricultural labourers were out of work, and during this enforced inactivity they were employed in other directions. The chief buildings in all ancient civilisations were the temples, tombs and palaces, and at that time the royal palace sheltered all the machinery of government and of commerce which centred there.

Ruins of Cloth Hall, Ypres; Consolidation Work in Progress.

Strand-on-the-Green, Chiswick. The recently-erected rubble wall along the river side at Strand-on-the-Green, towards the western end near Kew Bridge, has now been made to conform to the wishes of the Art Standing Committee of the R.I.B.A. by the addition of a wide stone splayed top coping, well weathered and projecting each side, by which means the random rough stone wall is made less conspicuous. By raising the walk along this extremity of Strand-on-the-Green the wall in question is almost entirely hidden. The remainder of the Strand walk remains as it was, and the R.I.B.A. has thanked the Chiswick Council for the consideration shown to the Institute's wishes. Those who value the amenities of the Thames will be glad to know that this part of the river is for the present safe from spoilation.

Hotel de Gand, Ypres, as restored. (*See p.* 800.)

GENERAL NEWS.

Professional Announcement.

Mr. George A. Allan, M.S.A., and Mr. L. W. E. Foster have removed to 5, Staple Inn, W.C.1. (Telephone: Holborn 4586.)

Appointment.

The Burry Port U.D.C. has appointed Mr. J. E. Vaughan Evans, Llanelly, as its Surveyor.

Rome Scholarship in Architecture.

In the list of names of those granted permission to take part in the Preliminary Competition for the Rome Scholarship in Architecture and the Henry Jarvis Studentship, 1924, given in our last issue, it was not clearly stated that Mr. Towndrow, Mr. Sisson and Miss Hargroves are students of the London University School of Architecture.

City Churches.

At a full session of the Church Assembly, held on November 17, the question of the City churches was discussed. Lord Robert Cecil said that the members in charge did not propose that the Assembly should come to a definite decision at the present session. Therefore, the matter was at present in abeyance.

Old Dutch Work in South Africa.

The Cape Institute of Architects have sent a portfolio of measured drawings of old Dutch work in South Africa for inspection by the R.I.B.A. Board of Architectural Education. The drawings were submitted in competition for the Cape Institute of Architects' Measured Drawings Prize. The Board of Architectural Education were impressed with the high standard of the work and Professor C. H. Reilly, a member of the Board of Architectural Education, has written an appreciation of the drawings.

Church Building Society.

At the monthly meeting of the Incorporated Church Building Society, held at 7, Dean's-yard, Westminster, on November 15, grants were made towards building new churches at Leicester, The Holy Apostles, £300; Newport, SS. Julian and Aaron, Mon., £300; Abercarn, St. Luke, Mon., £250; East Boldon, St. George, Durham, £125; rebuilding the churches at Brecon, St. David, £200; and Kidderminster, St. George, £75; and towards enlarging or repairing the churches at Barnwell Abbey, Cambridge, £40; Cheselbourne, St. Martin, Dorset, £40; Cold Waltham, St. Giles, Sussex, £50; Haggerston, St. Paul, £75; Ilton, St. Peter, Som., £50; Leintwardine, St. Mary, Hereford, £50; Nurstead, St. Mildred, Kent, £25; Orby, All Saints, Lincs., £30; Over, St. Chad, Cheshire, £70; Pensnett, St. Mary, Staffs., £100; Ruishton, St. George, Som., £50; Southwark, St. Peter, £50; Thorpe, St. Mary, Surrey, £15; Great Walsingham, St. Peter, Norfolk, £50; and Worthen, All Saints, Salop, £100. A grant of £100 was also made from the Mission Buildings Fund towards the erection of a Mission Church at Cefn Cribbwr, Penyfai, Glam. The following grants were also paid for works completed at Petham, All Saints, Canterbury, £25; Acton, All Saints, Suffolk, £50; Islington, St. Matthias, £100; West Thurrock, St. Clement, Essex, £15; Ford End, St. John, Essex, £40; Blackburn, The Saviour, £175; Ruishton, St. George, Som., £50; Bream, St. James, Glos., £20; Lannarth, Christ Church, Cornwall, £40; Abington Pigotts, St. Michael, Herts., £25; Thorpe, St. John the Divine, Yorks., £150; and Cwm Mission Church, Bettws-y-Coed, £35. In addition to these the sum of £630 was paid towards small repairs to 30 churches from Trust Funds held by the Society.

Cathedral of St. Martin, Ypres, under re-construction, November, 1923. (See

"Old London."

In aid of the Widows' Friend Society, a lecture, illustrated by lantern views, on "Old London," will be delivered by Mr. Herbert A. Cox, F.C.A., on November 29, at 5.30 p.m., in the Bishopsgate Institute, 230, Bishopsgate, E.C.2. Mr. A. C. Stanley-Stone, C.C., will occupy the chair. The lecture will be illustrated by lantern slides of old London and a model of Old St. Paul's (illuminated by electricity). Tickets (free of tax) 2s. 6d. (numbered and reserved) and 1s. 3d. may be obtained at 4, Catherine-street, Aldwych, W.C.2.

COMPETITION NEWS

Hereford.

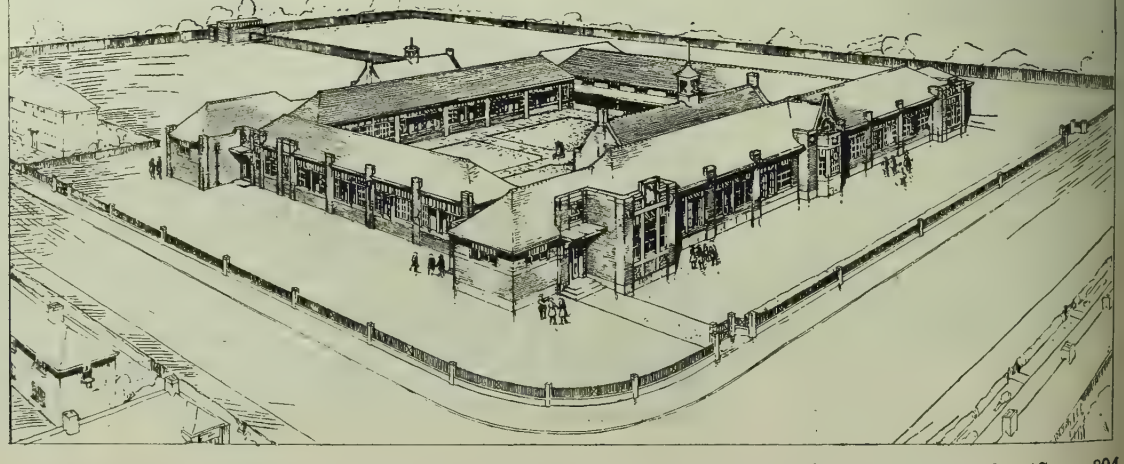
The Hereford City Council has decided to offer prizes for drawings and plans for the rebuilding of the Hereford Butter Market, and for the full development of the city on con lines.

New Art Gallery, Hull.

In this competition, Mr. John W. S P.P.R.I.B.A., the assessor, of London, h the following award:—

First premium (£1,000), Messrs. S. N. F.R.I.B.A., & E. C. Davies, A.R.I.I Montague-street, London, W.C. 1.

Second premium (£500), Messrs. J. S. & Gordon, 5, Old Bond-street, Londo



The first premiated design is given issue.

Barton-upon-Irwell.

The Guardians invite architects with ence in hospital planning to submit thei and qualifications. From these, twelve invited to submit designs. Mr. William F.R.I.B.A., is the assessor.

Other Competitions.

Other competitions still open incl following (the dates given are, first the in date, and second the issue of *The B* which full particulars were given):—Si College (Jan. 1, 1924; March 30) Memorial (Jan. 5, 1924; Sept. 14). E and Bishopstoke Assembly Hall—*Ba R.I.B.A.* (Dec. 3; August 24). Taunt Memorial (Nov. 30; Oct. 5). Memoria Missing (Jan. 1, 1924; Aug. 3). N Concert Hall (Feb. 1, 1924; Oct. 26). Empire Exhibition Decoration (De Oct. 26). Essays on Concrete (De Nov. 16). Edmonton War Memorial (N Nov. 16). Belfast Union Heating and (Dec. 18; Nov. 9). Essays on Heat Ventilating (Mar. 31, 1924; Nov. 9). Police and Fire Station (Dec. 18; No

New School at Becontree. Mr. J. Stuart, F.R.I.B.A., Architect to the Essex County Council. (See p. 804.)

ORRESPONDENCE.

We are glad to publish letters on professional and matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

"Charlatans and Pests."

—The first part of Mr. Overy's letter argument in favour of placing the architectural profession on a similar footing to that medical profession, an objective which society has for many years endeavoured to and which it will undoubtedly attain course with the support of Mr. Overy her members of the Society and of the on.

Overy seems to base his assumption that ters designating membership in the tural bodies convey little to the the street on a kind of general knowst which he has imposed on some of his but the fact that they have failed to does not necessarily imply that other are equally ignorant. Mr. Overy's better acquaintance with the letters ting membership in bodies representing allings is due, it is suggested, to the fact ose who practise these callings are able e them known through the medium of per advertisements, and he appears to grievance because architects belonging representative architectural bodies are d from advertising in a similar way. A flection will show Mr. Overy that there y legitimate and better ways in which ts may secure publicity if they wish to without infringing any written or uncode of professional ethics. He has adopted a method which I also advocate, t of press publicity under his own name. Overy does no more than glance at the apers and the professional journals he fail to be impressed with the fact that the leading architects are adepts in the rofessional publicity in the Press. There o other means by which an architect ep himself before the public, and far eing handicapped by restrictions in to professional publicity, the architect position, by the nature of his profession, nand much of the publicity which those on some other callings endeavour to y advertising.

Overy concludes his letter with a somenfused reference to a body which does st. He says it is interesting to note his body is doing for its members in ways, and then goes on to complain is not doing anything. Incidentally, ests an excellent title for whichever of hitectural bodies first becomes the one y representative body of architects in gdom. I hold no brief for an imaginary ut as Mr. Overy is in municipal employ be pleased to hear that long ago the which has the advantage of his support nber circularised all the local authorities ingdom, urging that architects should be in charge of their architectural work, ore recently in connection with the l Housing Scheme it has at least twice ised the same authorities, urging them ploy architects on housing schemes ring to supply the names of the Society ould carry out the work if the bodies ed had any difficulty in finding an archiSo successful was the Society's propahat it was accused, by a leading member indred institution in his address, of ssional conduct in what was alleged endeavour to get the housing work out ands of other officials of local authorities. tion to this general propaganda the is frequently in correspondence with al municipalities and public departments view to safe-guarding the interests of nbers.

se it may be supposed that Mr. Overy, mber of the Society, should necessarily ainted with the Society's past move- the directions indicated, it seems only him to say that he is comparatively a new member and one to whom the Society is much indebted for his support and for this opportunity of offering some observations on the subject matters of his letter.

C. McARTHUR BUTLER,
Secretary.

Society of Architects.

King's College New Buildings, Cambridge.

SIR,—As one interested in architecture, I beg leave to write to you on the subject of the proposed new buildings at King's College, Cambridge. Last week I was in Cambridge, and took the opportunity to inspect the designs. As examples of architectural taste they were particularly bad, and my sympathies went out to the assessor, who had no alternative but to select the least offensive of the works. No doubt before the buildings are started the College authorities will ask for some revision of the elevations.

"STAT HOMINUS UMBRA."

SIR,—In your issue of November 16, I observe that a letter appears with reference to the recent competition for the new buildings for King's College, Cambridge. The letter, which is signed by three of the unsuccessful competitors, Mr. T. S. Tait, Mr. G. H. C. Holt and Mr. V. O. Rees, impugns the competence of the assessor, Mr. C. Lovett Gill, censures the Building Committee of King's College for endorsing his award and accuses the winners of violating the conditions of the competition. It is incidentally a document that bears a curious and interesting likeness to the anonymous criticism of the competition that appeared in a contemporary journal for November 14, and that included special praise of the work of one of the signatories of the letter.

The attack on the assessor and on the Building Committee of King's must under the circumstances appear extraordinarily unsportsmanlike—to use an English phrase. If defeated competitors cannot take their beating in a more generous spirit, they should at least refrain from a public display of their chagrin, and not rush into print with suggestions that a lay committee ought to have refused to endorse the award of a Fellow of the Institute, and that the longer the successful design is studied the more dubious about it the Building Committee of the College must feel.

Questions of professional conduct are here involved that would seem to demand the attention of the Practice Standing Committee of the Institute. If nothing is done to impose some reasonable standard of loyalty and etiquette in competitions the prestige of the profession must be seriously damaged.

C. H. REILLY.

Liverpool.

"The Problem of London Traffic."

SIR,—Listening with great interest to Sir Lynden Macassey's review of the above subject at the School of Economics, I could not help being confirmed in an opinion held for a long time that it would be to the interest of the community were the late Royal Commission on London Traffic Improvement reconstructed with extended reference and powers, in order to bring the report up to date.

Appointed in 1903, it presented in two and a half years a most elaborate work, extending to eight volumes and costing the nation about £80,000. The subsequent expenses of its successors, the London Traffic Board and Ministry of Transport, must have about doubled that expense, so that it is safe to say that in two decades £150,000 has been spent *officially* in inquiry and suggestion.

Great changes have occurred since the Royal Commission reported motor traffic was in its infancy, aircraft in swaddling bands; the war wasn't dreamt of, nor the vast changes that have come as the aftermath.

Moreover, one government after another, both before the war and since, have been baffled as to the best course to pursue in the interpretation of the Commission's report, or inaction in regard to the subject generally, which, it ought to be recognised more fully, is bound up with "London Government," on which a somewhat abortive report has appeared recently.

The Commission did not look upon its report as the last word on the subject. On the contrary, it spoke of the hope of "a well-considered plan" being produced. Up till now it hasn't appeared, but any number of piecemeal suggestions await investigation from which it is believed the desired plan can be made up.

If that is not done, there is the danger of the Metropolis becoming the subject of further botch—in fact, it is imminent.

O.B.I.T.

Town Planning in Kent.

A meeting of the East Kent Regional Joint Town-Planning Committee was held at the Guildhall, Canterbury, on Monday with representatives of the local authorities concerned, under the chairmanship of Mr. A. P. Rice. A motion by the Mayor of Dover was proposed, to approach an eminent town-planning expert with a view to preparing a regional outlying scheme and report, and the name of the President of the Town Planning Institute was mentioned. A feature of the Town-Planning Exhibition opened at Olympia, as part of the Commercial Motor Exhibition, is a large number of models demonstrating town-planning schemes, lent by Birmingham, Glasgow, Manchester, Liverpool, Leeds, and other large corporations,

Semi-Permanent (brick and wood) Workmen's Dwellings at Ligy Garden Suburb, near Ypres. (*See p.*800.)

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

THE REBUILDING OF YPRES.

MR. G. TOPHAM FORREST, the chief architect to the London County Council, delivered a lecture on Monday, at the Hall of the Royal Society of Medicine, on the subject of the "Rebuilding of Ypres." The chair was taken by Mr. J. A. Gotch, the President of the Royal Institute of British Architects.

The lecturer said that at the end of the war the devastation of Ypres was so complete that it looked as if the town was destined to be a great silent mound—a pathetic token of the struggles of the British Army on Belgian soil. Fortunately neither the Belgian people nor their rulers shared that view, and at the present time the ruins were being rapidly transformed into the Ypres of pre-war days. In addition to the town of Ypres nearly two hundred and fifty communities in Belgium suffered greater or less devastation, and all over the country incalculable injury had been done to the roads, railways, telegraphic and telephonic installations, waterworks and canals, and as soon as the capital was re-entered, the Belgian Government announced that one of the first duties of the country was to consecrate the national energy and resources to the task of helping the devastated regions to make good their enormous losses. Ypres, which among all the ruined districts was the one which had suffered most from the devastations of war, was, with Louvain and Dinant—those other great Belgian sacrifices—among the first communities to benefit from this special law. About the middle of 1919 it was, as it were, adopted by the nation, and from this fact was assured of the technical and financial assistance of the State and of those organisations specially created to assist in the prompt re-establishment of the country. Important provisional arrangements were at once made for housing the necessary public services and the first repatriated inhabitants. Great huts were erected to shelter the various public services. The task was at this time most difficult, for means of communication, railways, waterways and roads, had totally disappeared, transport failed and labour especially was lacking. The work was, nevertheless, carried on rapidly, and in a few months quite a small town of nearly 1,000 huts was built in the neighbourhood of the site of the vanished town.

The major part of this temporary village still exists and will only disappear on the completion of the reconstruction works, for it shelters a great part of the working population gathered from all parts of the country for the purpose of rebuilding the town. But the building of this village of huts, however urgent it was, and however difficult it might have been to achieve, was, after all, no more than a preliminary and only a small thing compared with the work—with even the preparatory work—still to be done. Those who did not see the ruins on the morrow of the armistice, or during the months immediately following can form no idea of the labour and energy required to render the reconstruction possible. The masses of ruins, fallen in disorder, had obliterated almost the very trace of the streets; in most parts the destruction was so complete that the foundations even had disappeared. And the formidable task to be undertaken was further complicated by the fact that it had to be carried out with due regard to the past history. There was no question here of founding a new town on virgin soil, but of rebuilding an ancient city out of its own ruins, and on its ancient site, exactly as it had been handed down from long past generations. The devoted zeal of the authorities and services, therefore, was bent on the patient and methodical clearing of the ruins, on the classification of the recovered materials, on the slow and laborious search for traces of the town's communications, on the patient uncovering of the water services and sewers, both destroyed and dispersed underground. The task called for weary months of self-denial and goodwill, and more than 4,000 workmen were engaged on it unceasingly up to the beginning of 1921, and it was only then that it was sufficiently advanced for a first beginning to be made on actual building work. From this time, the heaviest part of the work having been completed, and the prospect of final victory in sight, restoration work of every kind marched with giant strides, and wondering admiration was felt at the marvellous sight of the city being re-born and already almost reconstructed. The question of deciding whether to reconstruct all the buildings or to preserve the more important ruins as a witness to the horrors of the Great War, gave rise to much controversy. It had been thought by many that the ruin of the Cloth Hall and of St. Martin, especially, should be retained in their impressive grandeur. The question as regarded the Cloth Hall had not been definitely decided. Up to the present in Belgium the financial question had dominated the whole problem, and the authorities wisely decided to devote the funds available to reconstructions of immediate utility. It was, however, to the reconstruction of private dwelling-houses—as the following table shows—that the authorities have specially devoted themselves, and what was only some three years ago an immense field of desolation and death, was to-day a vast workshop in full activity where homes were already rising by hundreds with a rapidity which shows a daily progress.

No. of houses: before the war, 3,780; destroyed, 3,780; left on December 31, 1918, 0. Situation at the end of September, 1923:—Dwellings: inhabited, 1,500; fit for habitation, 200; in course of reconstruction, 789 tempo-

Post Office (known as Templar House), Rue de Lille, Ypres, a restored: March, 1923.

rary buildings, &c., 750; Total numb dwellings, 3,239.

As regards State intervention of the dwellings rebuilt, orbeing rebuilt, there w Buildings reconstructed by the Gover (department of devastated regions), new buildings constructed by the State (wo class estates of Kalvaart and Ligy), buildings reconstructed by means of ad trative advances agreed by the departm devastated regions, 491; buildings structed by war victims as a result of ments by the war damage tribunals, total 2,489.

The rate of progress in the carrying out work may also be realised from an exami of the figures relating to the population town at various dates:—No. of inhabi before the war, 18,056; on December 31, 0; on December 31, 1919, 2,126; on D ber 31, 1920, 5,871; on December 31, 9,450; on June 30, 1922, 10,465; on Se ber 30, 1923, 13,053.

It should be realised, however, tha all the buildings, without exception, been reconstructed exactly as they were the war. There were at Ypres, as in m the destroyed localities, certain workin districts in which there was a numb old buildings, the reconstruction of would have been neither possible no

sequence of the General Election, the Public Lectures, by Major Harry .P.R.I.B.A., and Dr. A. K. Chalmers, are being postponed until the New

Grande Place, Ypres: March, 1923.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

THE following are notes from the Minutes of the November 5 Council Meeting:—

The City Churches.—It was decided to issue a public protest against the threatened demolition of City Churches.

Preservation of Places of Natural Beauty or Historic Interest.—It was decided to join the Royal Academy, the Society for the Protection of Ancient Buildings and the Society of Antiquaries in sending to the Chancellor of the Exchequer a proposal for exempting the owner of any places of natural beauty or of historic interest from Schedule A of the Income Tax chargeable upon that property, provided that he keeps the property in such repairs wil prevent decay and allows reasonable access to members of the public who wish to enjoy the beauties of the place or to appreciate its historic interest.

Royal Commission on Fire Brigades and Fire Prevention.—It was decided to appoint a joint Committee of Members of the Practice and Science Standing Committees to collect and collate reports from the Allied Societies on the Report of the Royal Commission on Fire Brigades and Fire Prevention and to advise the Council as to any steps which it may be desirable to take in connection with the Report.

Lay out and Town-Planning Competitions.—It was decided to take steps to arrange an early conference of representatives of the Town-Planning Institute, the Town-Planning Committee R.I.B.A., and the Competitions Committee R.I.B.A., to consider and report to the Council R.I.B.A. upon the whole question of Town-Planning and Lay-out Competitions.

Illegal use of R.I.B.A. affix.—It was decided to publish a note annually in the R.I.B.A. Journal and the professional press calling attention to the fact that the use of the R.I.B.A. affix, or of any affix suggesting membership of the R.I.B.A., by those who are not members of this body, is illegal, and that if any cases are reported to the Council legal proceedings will be taken.

The Charter and Bye-laws Committee.—Mr. Maurice E. Webb was appointed as an additional member of the Committee.

Road Access to the London Docks.—It was decided to communicate with the Port of London Authority and the Minister of Transport to the effect that the Royal Institute is glad to note the probability of the above improvement, and will be glad to be assured that the work is likely to be proceeded with during the winter.

Undercutting of Fees.—Under the provisions of Bye-law 24 a member was severely censured for quoting fees lower than those prescribed by the R.I.B.A. Scale in competition with other architects for an appointment under a public body.

Competitions.—A Licentiate was expelled for taking part in a banned Competition.

R.I.B.A. Examinations:—

(A) *Probationership.*—It was decided to accept Chemistry as an alternative to Physics, Mechanics, or Higher Mathematics in the qualifications for the Probationership.

(B) *Town Planning.*—It was decided to institute a special Examination for members of the Royal Institute leading to a Diploma in Town Planning.

(C) *Final Examination.*—The Board of Architectural Education reported to the Council that the following Students of Recognised Schools exempted from the Final Examination had passed the Examination in Professional Practice: Donald Brooke, Isabel M. Chambers, J. A. Coia, George H. Crickmay, James D. Ferguson, E. Maxwell Fry, Edith Gillian Harrison, E. H. H. Higham, Harold Hirst, C. H. Hutton, C. G. C. Hyslop, C. R. Knight, Doris Musker, Mohammed Raafat, T. Scott Sutherland, R. W. H. Vallis,

(D) *R.I.B.A. (Archibald Dawnay) Scholarships.*—The Board of Architectural Education reported to the Council that the following awards had been made: One Scholarship of £50 per annum to Mr. R. W. Donaldson, Liverpool University; one Scholarship of £25 per annum to Mr. R. H. Turner, Liverpool University; one Scholarship of £25 per annum to Mr. A. E. Cameron, Architectural Association; a renewal for the year 1923–1924 of the Scholarship of £25 awarded in 1922 to Mr. C. H. Hutton.

(E) *R.I.B.A. (Henry Jarvis) Studentship at the Architectural Association.*—The Board of Architectural Education reported that they had approved the award of the Studentship of £50 to Mr. Arthur Edwin Cameron.

Membership.—(A) The nominations of 21 candidates for the Fellowship and 30 for the Associateship were approved.

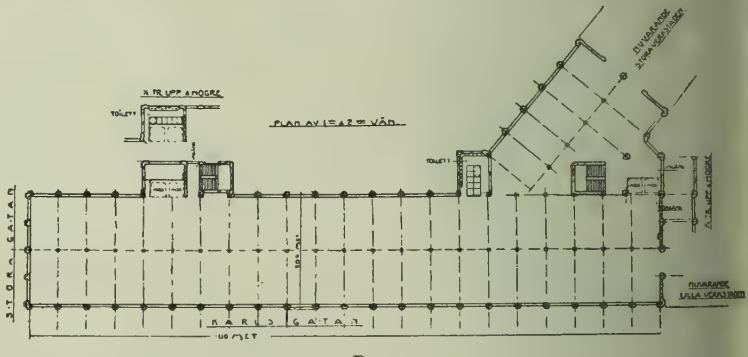
(B) Mr. F. E. F. Bailey (elected Associate 1879, Fellow 1905) was transferred to the Retired Fellowship.

Houses at Ypres: January, 1922.

FACTORY DWELLINGS, VÄSTERAS, SWEDEN.

By GEORG BROCHNER.

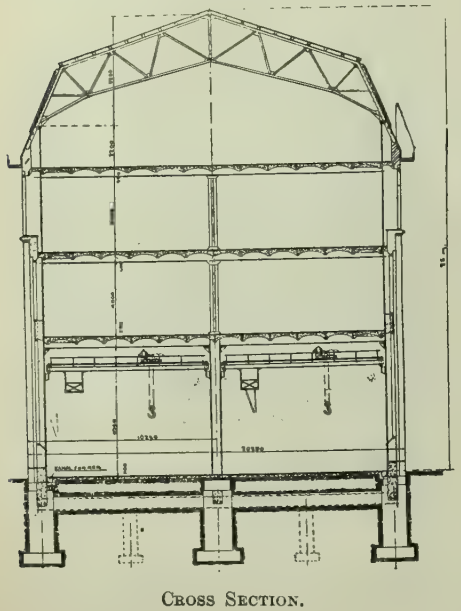
The General Swedish Electric Company's factory is from the designs of M. Eric Hahr, while M. Fritz Söderbergh, civil engineer, and some of the company's own engineers are responsible for the interior construction and arrangements. The building of this huge factory necessitated the acquirement of additional extensive areas from the city, including a couple of streets, and the part of a stream, 600 ft. long, which had to be filled up and sewers constructed in its place.



The foundation presented some difficulties, and concrete piles had to be carried to a depth of 24 ft. The front of the main building has a length of 113 metres. The height of the building is 25 metres, and its depth 20.5 metres. The building covers an area of 3,000 square metres, and contains a floor area of 12,000 square metres. The main front building has four stories, and the wing five. The height of the ground floor is 7 metres, of the first and second floors 4.5 metres, and for the upper floor, where the windows are in the roof, 8 metres.

The main structure is entirely of steel. There is a heavy concrete pillar under each brick pillar, connected by reinforced concrete beams. The pillars of the walls are covered with brick, and these constitute the frontage. The floor of the ground floor is of concrete covered with asphalte. Other floors are of concrete, covered with asphalte or wood, according to requirements. The load for the ground floor is calculated at 3,000 kilograms, for the first floor 2,000 kilograms, for the second 1,500 kilograms, and for the top floor 1,000 kilograms per square metre. The pillars on the ground floor support two parallel traverses; the load on the central pillars of the ground floor is about 300,000 kilograms, and a little less for the outer pillars. The fact of there being only one interior row of pillars gives better light, more room, and allows the traverses to be used in either side.

The window space occupies more than three-fourths of the walls, and they have been made as high as possible. The traverse arrangements have necessitated the stairs, which are broad and light and of reinforced concrete, being placed in special side buildings, where are also the elevator shafts, lavatories, &c. There are four elevators, each of 3,000 kilograms capacity; each elevator accommodates 20–30 persons, but during working hours they are intended for handling of goods.



The company has been its own builder, where necessary employing some special firms; but the entire steel construction was made at its own works and all the woodwork by a branch establishment. The building is heated by steam.

PLAN.

Works of the Swedish General Electric Co., Vasteras, Sweden.

CROSS SECTION.

We illustrate a square of workmen's dwellings built by the company, and at very favourable rents let to the men. It is to the credit of Swedish workmen that they much appreciate a good house, which is almost invariably kept in good order, and the managing director of the S.G.E. Co., Mr. Edström, is much interested in providing good residential conditions for his men.

Cost of House Repairs.

In the House of Commons last week, Sir Wm. Joynson Hicks, replying to Mr. Rhys Davies, said that the cost of repairing houses erected by a local authority under the Housing, Town-Planning, &c., Act, 1919, was defrayed from their Repairs Fund, to which was normally allocated 15 per cent. of the rents of the houses. The returns of several of the larger authorities showed that the average annual expenditure on repairs per house had been 5s. 2d.

MEETINGS.

Hull Art Gallery.

We give this week the design placed first, by Messrs. S. N. Cooke, F.R.I.B.A., and E. C. Davies, A.R.I.B.A., in the competition for the new art gallery at Hull. The full result of the competition is given on p. 798.

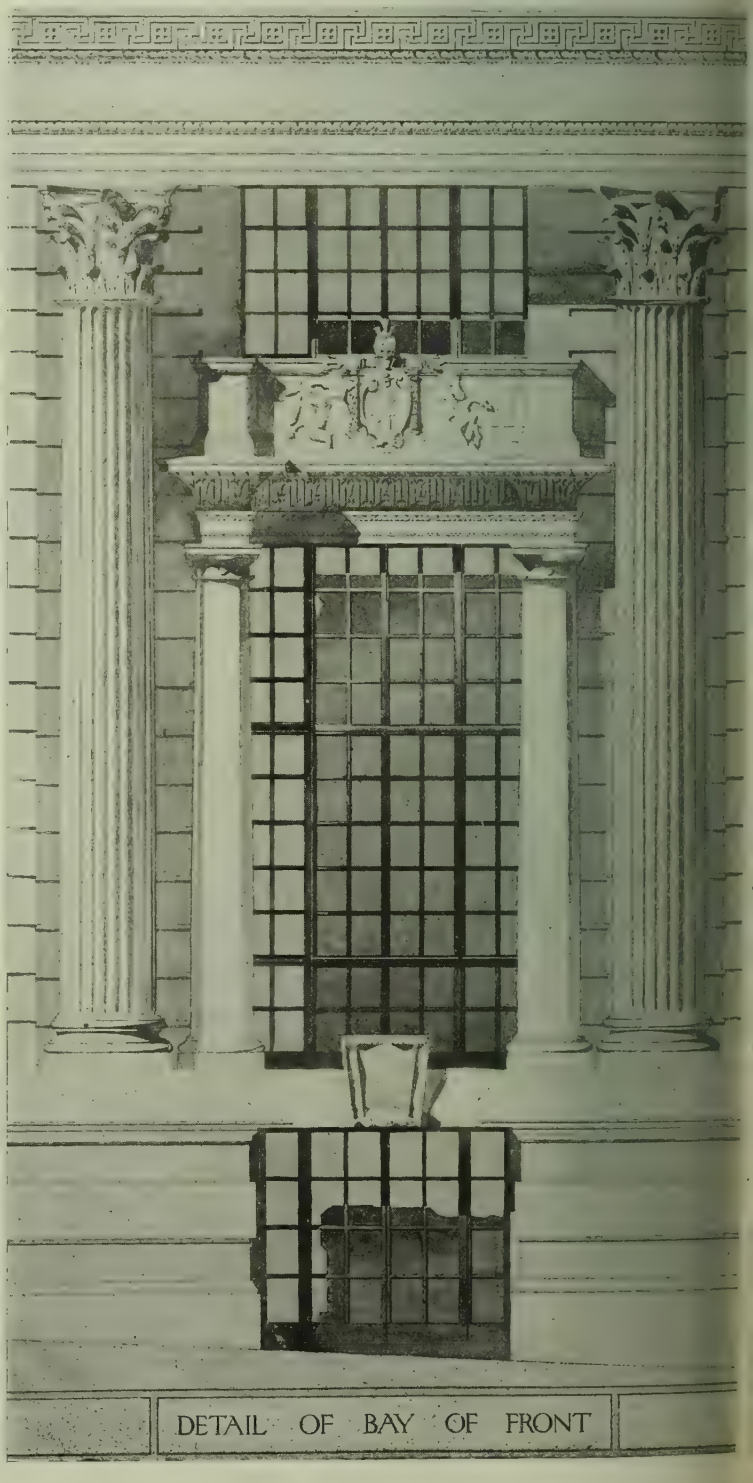
Manchester Masonic Temple.

The exigency of the Press and dependence on photography sometimes interfere with our plans, and we were unable to reproduce the fine interior of Messrs. Thomas Worthington & Sons' accepted design for the East Lancashire Masonic Temple at Manchester with the illustrations which we gave in our issue of October 26, but we now give it, and also the plans to a larger scale than was before possible. The interior graphically illustrates an important and admirable feature of the building.

Design for the Holt Line Premises, Liverpool.

We give this week the design submitted by Mr. Curtis Green, A.R.A., F.R.I.B.A., in the recent competition for new premises for the Holt Line. The selected design, by Mr. Arnold Thorneley, F.R.I.B.A., and Mr. Herbert J. Rowse, A.R.I.B.A., was given in our issue for October 12; and the designs submitted by Sir Edwin Cooper, F.R.I.B.A., and Messrs. Willink & Dod were given in our issues for October 19 and November 16 respectively.

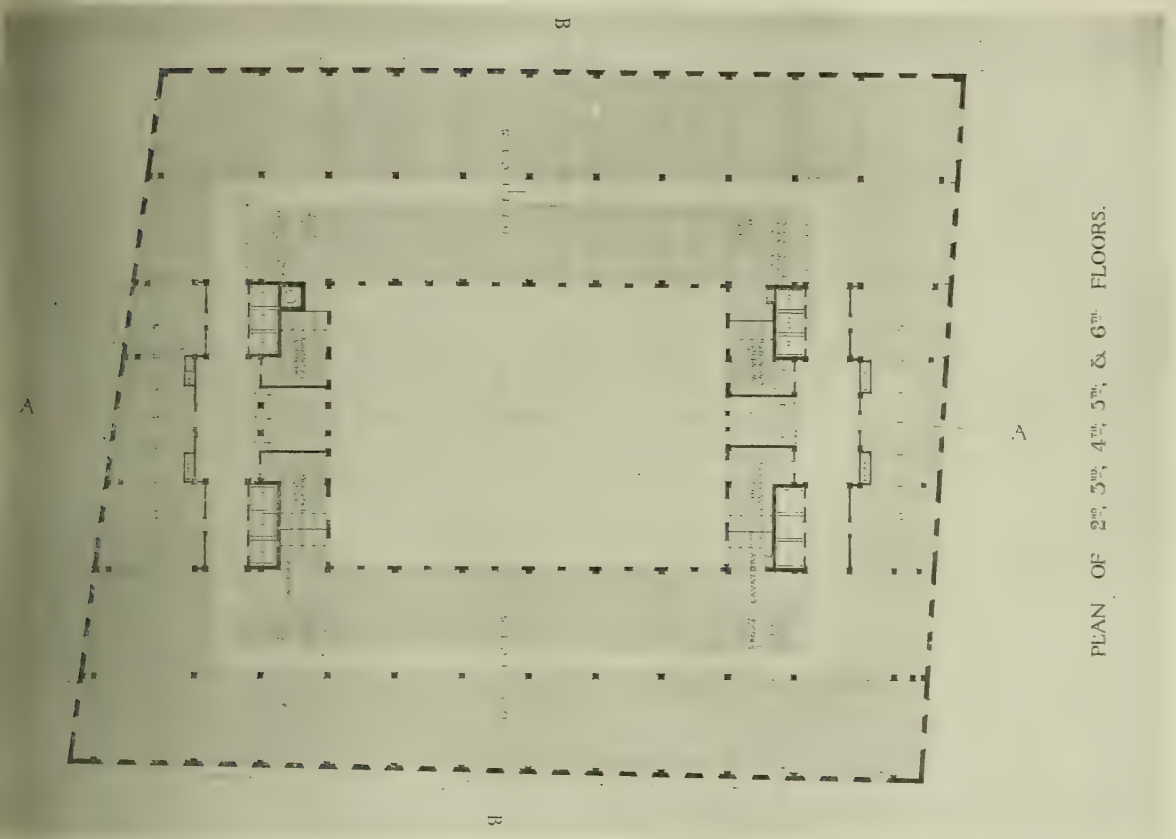
Greenwich Baths Competition.



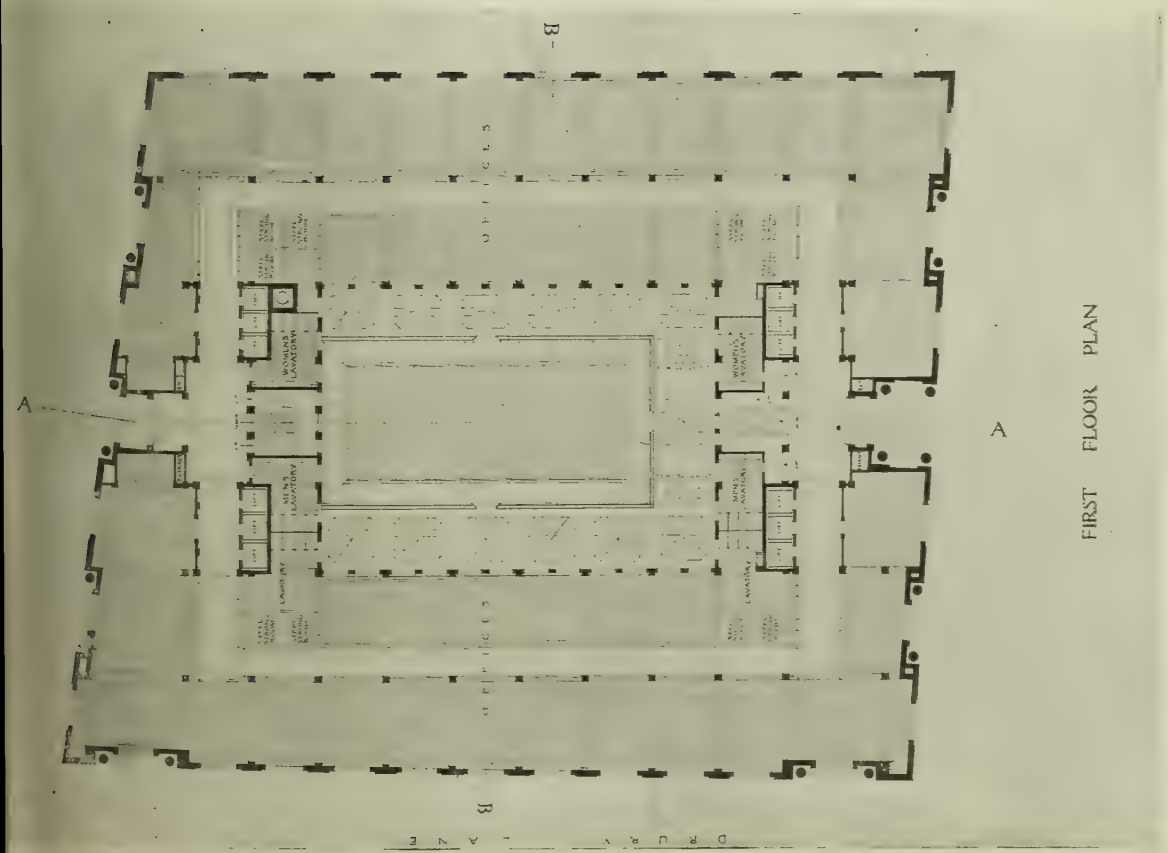
The design for Public Baths and Washhouses at Greenwich was submitted in the recent competition by Mr. R. Stephen Ayling, F.R.I.B.A. The designs placed first and second, by Messrs. F. J. Horth and H. Andrew and Messrs. Horace Field and Dighton Pearson, respectively, were given in our issue for October 12.

Proposed School at Becontree.

Until the advent of the London County Council housing scheme in the Becontree district, Dagenham (with the hamlet of Becontree) was a typical country village, noted chiefly from an architectural point of view for its ancient church of St. Peter and St. Paul, the chancel and aisle of which date from the eleventh century. In September, 1921, it was announced that the London County Council had arranged to erect 1,306 houses in the Romford section of the Becontree district, and to meet the demand for school places for the anticipated new child population (in addition to enlarging existing buildings) negotiations were opened with the London County Council by the Essex County Council Education Committee for the purchase of a site, about 2½ acres, upon which to erect an elementary school for 1,050 children.



The new school consists of a quadrangular plan containing twenty classrooms for 50 scholars each, together with a babies' room for 50. All classrooms are cross-ventilated and are of the semi-open-air type. There are two assembly halls, together with the necessary cloakrooms and lavatory accommodation. For the juniors of each sex the offices are attached to the main block, whilst a separate sanitary block for older children is provided in the playground. Provision is also made plan for instruction rooms in woodwo housewifery; staff rooms and offices for t of both sexes are included in the scheme.



The building is being erected of re with artificial stone dressings and tile The heating arrangements are to be b pressure hot-water pipes and wall ra Artificial lighting will be by gas, there no electric current available at present estimated cost of the buildings, based quantities and competitive tenders, is The building is being erected by direct under the personal supervision of M Stuart, F.R.I.B.A., the Architect to the County Council.

X.—Intention.

not know why the preliminary con- n of the requirements in a building e regarded as a French method of ng architecture. Certainly the French ploited it very thoroughly, but none t appears to be just ordinary common Buildings do not spring from the brain chitect as Minerva from the forehead r: they result from a minute study of ose for which they are intended. The information has to be acquired from re or someone—from a building or a om a person familiar with the facts, professor or patron, employing the l as indicating the client or building If the person or persons for whom ing is intended do not know what it hey require, who does? The client e too copious with his information, rchitect too careful with its collation. er for a moment the simple case of a ho wants to build a house. The has ideas in his brain for many though none of them may coincide e requirement of his friend. It is r, therefore, if time is not to be o learn from the friend at once what requirements. If he is to be pleased accomplished building it must bear a emblance to his anticipated needs. If es he will be delighted.

house is after all the most easy with which an architect has to We all live in them. Because we amiliar with houses in general we meticulously careful to learn the be fulfilled by a house in particular. ed for information is amply realised e theme is one upon which the de as not previously been engaged or ch he is entirely unfamiliar. In such nces some architects decline the The more courageous accept it. I at this is a debatable decision, and was solved by a distinguished man ined a very large undertaking and at time recommended another architect fitted to take upon himself the work he other had had previous experience tention of the promoter. But such an is rare, and does not affect the argu- Specialists make themselves. It is, possible for any of us to follow mple by doing our best with each ity that we have.

are so many highly developed pro- hat it is impossible for the best- to have more than a vague concep- what is needed. But we can bring upon their criticism general ideas ng labour and waste of material and y machinery or men.

Bakers' ovens, brick-kilns, and boiler settings are simple matters to bakers, brickmakers, and boiler builders; they may be mysteries to ourselves. Turkish baths, synagogues, crematoria, what do we know about them? Very little. Banks, hotels, shops, we are on more familiar ground, for, as in the case of a house, we use them all as members of the community; yet do we recognise the point of view of the cashier, the director, the porter, in each of them? Unless we study the outlook of these individuals and many others nearly or remotely connected with it, and attempt to adjust the building to their united needs, we have not done our duty. Indeed, the lack of a fully realised idea of what is desired in the completed structure is the chief cause of an unsatisfactory result.

Banks, hotels, shops have one thing in common—the public use them all. If this implies anything it is that the entrance should be easy to find and clearly marked. The whole of them want our custom. The bank hopes we will conduct our business with celerity; the shop, that we leave before closing time; the hotel will be better pleased if we stay the night. The bank seeks to impress upon you its security, the hotel its comfort; the shop, of your need for the commodities in which it deals. It is unnecessary to continue the further elaboration of these three types of building; but a more extended consideration of any one of them will indicate the ramifications into which the study of intention leads, for every separate activity, retail or manufacture, religious or educational, artistic or legal, entails the realisation of intention before it can be housed. Let the shop stand for them all.

The chief concern of the shopkeeper is to persuade the public to buy his wares. He must sell by post or by agents, or over the counter. If the last method is employed he must attract the public to his premises by advertisement or publicity of sorts. In times past this used to be done by—

> . . . hoarsely shouting men, who greet
> Buyers as wind greets trees.

The like office is now performed by electric signs, or, in Paris, by little maps hung up at the street corner, with an arrow and a spot; the arrow represents the passer-by, the spot being the shop to which he is directed by the shortest route on the distressingly simple map. Having persuaded us to seek him out, the proprietor has to inveigle us inside. This he does by stages; his windows are so disposed and dressed as to cause us to pause and inspect their contents, they are graduated so as to lure us to the entrance and through inside: everything that can help him to succeed in this should be considered. As it is largely a question of holding the attention of the customer by the display of articles of common necessity at an attractive price, the windows near the entrance must be suited properly to show them. Once inside we must be kept in, and though not asked to buy we must be tempted to do so. The open access system is psychologically the most effective; for unless the customer sees the article, only such goods as he wants will be sold. It is by suggesting to us the need for things we do not want that the shopkeeper is enriched.

The departments in a large composite store must be grouped upon a systematic basis, one article leading naturally up to another, avoiding the disturbance of the corset department in search of a collar stud. It is injurious to disturb the business of any department by passing through. The circulation of the customers all over the building is of great importance, not only on each floor but to all floors. Give confidence against fear of fire. Whilst generally every artifice which can be devised to display the goods is of great moment, care must be taken not to offend the temperament of the type of customer on the score of too much stridency or too great reserve. Light, space, comfort, ventilation, a rest room, a writing-room, a post office, a theatre, even a crêche—all directed insidiously to render shopping a pleasure to the customer.

The second general consideration is the stock: where it is selected, unpacked, stored, and how dispatched. It should be easily handled, displayed not stored; stored, it is idle capital out of sight. As much ingenuity can be employed in the dispatch of goods after they are sold as in the selling of them. The whole problem should be reviewed afresh from different angles.

The third point of view is that of the staff, upon whom everything hinges ultimately. They look upon basements with less favour the closer they are confined to them. They know their way to the premises. They must have somewhere to put their bicycles, their coats and hats, change their shoes, wash and dress, rest when they are tired, feed when they are hungry, all detached from the working part of the structure and as different as possible in character.

There are many other points of view from which to regard the building, and the consideration of the items which have been touched upon could be enlarged indefinitely. The architect, then, has his hands full: all his ability will be needed to reconcile these varied requirements; to weigh and balance their respective importance; and to express them in building. As a first step to the successful solution of any problem we must realise the intention of a project, be that project what it may.

Development Scheme for Leicester.

The estimate for the cost of an internal development scheme for Leicester, which is being considered by the Leicester T.C., is put at a gross total expenditure of £3.829,649.

TOWN PLANNING & TOWN DEVELOPMENT.*

A BOOK on town planning by Professor Adshead is a most welcome addition to the rapidly growing bibliography on the subject, and we are promised further good things, for this volume, dealing with the social and administrative conditions that influence town planning at the present time, is the first of a series dealing with the various branches of the science. The author tells us that he intends the series to form four primers. A student will be fortunate to commence his studies with a text-book so interestingly written and so well got up as this. We like the opening chapter. In its sixteen brief pages the sociological basis of town planning is presented in such a manner as to leave no doubt in the mind of the student as to the right foundation he should choose for his studies. Having studied man's relationship with man, we come next to that existing between towns—a refreshingly new presentation of these old facts. The organic structure of the town itself is then considered, and as a living, throbbing entity, its manifold functional organisation is studied to give true understanding of the whole.

Much has been said of late on transport and traffic requirements generally. Professor Adshead urges reconsideration of the present system and specially of the needs of our new industrial areas, such as Kent and South Yorkshire, where the recently established centres of the coal industry are already drawing to those districts other industries. It is hoped that the interests of all concerned, and the many complex problems involved, will be met by the application of the scientific laws of regional planning. As regards passenger traffic, the various needs of the individual on long and short journeys are considered. Regretfully the author tells us of the £11,000,000 spent by the L.C.C. on tramways for London, when the public had already discovered that motor-'buses better met their needs. In Professor Adshead's opinion the £11,000,000 had better have been spent on street widening and improving street surfaces.

The power the London Tube Railways wield in moving populations and fixing new residential quarters is an interesting study, and whilst welcoming the new areas opened out, Professor Adshead voices a warning that it is not always desirable that residential property should be too accessible. The running of a railway to a small suburb of middle-class houses, which formerly was situated, say, one mile from a railway station, will probably make the land in the vicinity more saleable, but in so doing it may depreciate very seriously the houses already there.

Speaking of roads and traffic requirements, the author takes what we will venture to call a somewhat contradictious attitude to the very generally accepted view that we must widen our overburdened streets. Perhaps it is this fact being so widely accepted by road and county engineers throughout the country which has made the author question their premises and has driven him to find other and what appear to him to be better solutions of this pressing problem. Whilst welcoming every suggestion made—and one from Professor Adshead is sure to receive the consideration due to it—there are many who will be unable to agree with the view he takes. It would seem that some of his suggestions fail to meet adequately the need, and therefore are not practical propositions. "To convert certain narrow streets into ways for pedestrians only during certain times, and certain wide streets narrower and traffic diverted," may or may not be theoretically correct, but it is certain that the idea, besides being thwart with great practical difficulties, would never commend itself to liberty-loving Britons proud of their King's highway.

Professor Adshead says: "It is far better to have a narrow traffic way constructed with first-class surface than a wide road badly made, because space can be found for twice as much traffic proceeding at thirty miles an hour as at fifteen, and with a wide angle of vision and a good surface, such roads need only, as a rule, be about 20 ft. All things considered, 20 ft. is the right width for a trunk road in the country."

In dealing with road problems to-day, we must, however, bear in mind three things: (1) That transport of goods by road is still rapidly increasing, and it is fair to say, as motors and petrol become cheaper, road transport will assume, within the next few years, proportions not yet dreamed of; (2) that size and speed of all petrol-impelled vehicles will increase; and (3) that we are on the eve of very much cheaper motors, both for business and pleasure, and it is fair to assume that the remarkable increase of motor cars will continue at an increasing ratio.

To Professor Adshead's widths, viz.:—

Main roads outside, but between towns, 20 ft.,
Main roads immediately outside built-up area, 30 ft.,
Main roads in built-up streets, 40 ft.,

there are many, no doubt, who would like to add to each a further 20 ft. It is not perhaps made sufficiently clear that, although he advocates a comparatively narrow road surface, the actual width of road between hedges should be, with as few exceptions as possible, 60 ft., which was the width laid down by the General Turnpike Act so far back as 1773.

There is an interesting chapter on Road Administration, taking us back to 1285, when, by the Statute of Winchester, the responsibility of keeping roads open was placed on landowners and certain prescribed persons. An Act of 1691 directed surveyors to make roads at least 8 ft. wide. In those days and until, in 1654, the Commonwealth Parliament passed an Act "for amending and keeping in repair the common highways within the nation," and provided a rate not exceeding 1s. in the £ for road-making, the finance for roads was dependent upon fines. Many and varied were the bodies and trusts who had charge of the roadways in the seventeenth and eighteenth centuries, and whose business it was to find the necessary money for their repair. Under the turnpike regime, we are told, the London to Manchester stage-coach paid as much as £7 per annum for the upkeep of each mile of road. The final step in road jurisdiction was, of course, the transference of the work of the Road Board to the Ministry of Transport in 1919, under whose administration much new work has been accomplished and many improvements effected. It is interesting to note that in 1921–1922 the receipts from the Motor Tax Account alone brought to the Ministry £10,795,000. In the same period, £7,239,637 was contributed to the cost of constructing main roads and bridges; £590,256 in road widening and surfacing; and £4,405,916 as a contribution to the cost of using unemployed labour on road construction.

About one-third of the book deals with Municipal Housing and the early and recent Housing Acts. To have this legislative matter sorted and summarised as it is by the author will be a boon to many a student, and his epitome of the procedure under Town-Planning Acts will be welcomed by many older students.

*"Town Planning and Town Development." By S. D. ADSHEAD. (London: Methuen & Co., Ltd.) 10s. net.

Reconstruction in Japan.

The Times understands that the Reconstruction Budget Committee's report provides for a total expenditure for Tokyo and Yokohama of 705 million yen (£70,500,000) over a first period of six years ending in April, 1929. The work will be spread over several periods in order to avoid, as far as possible, the necessity of a foreign loan. The estimates cover the cost of roads, canals, and parks, and also subsidies for assisting industries, rebuilding public buildings, and interest on long-term municipal loans.

THE GOLDEN AGE GREECE.

IN his second lecture on ancien architecture, at the Central School of Crafts, on November 14, Sir Banister passed from the primitive period to t of perfection, and reviewed the con religious, geological, and geographic led up to the architecture of the dev "Hellenic" type, which, as always, re national life. The sea had a unifying the Greek nation, which, owing to the board, the harbours, and the inn island stepping-stones of that countr maritime people, and colonised by not by conquest, among the island Aegean and round the Mediterranea international intercourse is reflected resemblance of several features of Gre tecture to certain characteristics in Assyrian, and Cretan art. This was rapid development. The rough Mycen work was transformed by the subtle Gr into the perfect form of the golden age architecture, achieved with almost suddenness. This was the great temple period, and the transformation was marvellous when we remembered proud temple of the god had its ori humble tent for man. The priests we exclusive class, and there was non Egyptian sacerdotalism, and thus t "naos" for the statue of the god took of the mysterious halls of the Egyptian were other contributory forces at work duce that wonderful beauty of si A clear climate demanded fineness of the wealth of native marble from Mou licus rendered possible the pure line surface and close joint which cloth buildings with mysterious beauty, wh dance of golden light played over the and enhanced the rich hue of the marbl colouring which appears sometimes been employed. The creation of citi over, led to a municipal zeal which gave to art. The building sites were usual near a hill for safety, the walled are summit being known as the "Ac somewhat resembling the commanding of a mediæval castle. Sir Banister Flet interesting views, and brief vivid des of Olympia, Delphi, Athens, Selinus, gamon, indicative of the spread of over Asia Minor to the eastward an Italy and Sicily to the west. At th city, the victories over the Persians impetus for the blaze of artistic ach seen in the Parthenon on the Acrop other buildings, early in the fifth cen —the summit of achievement in thi centre of the building art.

ARCHITECTS' AND VEYORS' ASSISTAN PROFESSIONAL UN

IF architectural assistants are as ent in their work as they are in their pl and there is no reason to doubt it— profession is indeed fortunate. On T last week a large number of member Metropolitan Branch of the Archite Surveyors' Assistants' Professional Un present at a smoking concert held a in the Strand—the scene of similar g in previous years—and under the chai of Mr. E. Fiander Etchells, Past-Pres the Institution of Structural Engineer thoroughly enjoyable evening. One from the brief speeches that the Union in a strong position, and that the mer throughout the country was rapidly in Among the artists who contributed excellent entertainment were Carlton. manipulator, and Rameses, an illusio

ICHESTER SOCIETY OF ARCHITECTS.

irst meeting of the Session 1923-24 of ociety was held recently at the s rooms in the Parsonage, Manchester, he President, Mr. Francis Jones, .A., gave the annual address to the s, from which we take the following:

now firmly established Conference of its of Allied Societies, which meets nes a year (or on other occasions if business requires it), also reports to ncil of the Society. In this way the is kept informed very thoroughly of ngs of the profession, not only as the Royal Institute, but also regard- whole of the allied societies, which, se, embrace the whole of the United n and include many architects other yal Institute members.

dition to the usual meetings and ses- apers, he have again joined the Uni- and Institute of Builders in holding blic lectures at the University. These have become an institution; they are ly well attended, and I am sure give ius to the lay interest in architecture, s of such vital importance not only to fession but to the whole country.

g the year the Rome Scholarship has on by a student of the Manchester ity—a member of our Society. I am r congratulations go out both to the ster School of Architecture and to the Mr. Cordingley. The Society has hard for the school for many years. r during the last year has the school become a definite self-contained unit University, with its own studios and its mplete staff. It is perhaps difficult present generation of students to how well off they really are, and there no doubt that the benefit will not be to the students, but that the whole d neighbourhood will reap a gradual in living amongst better buildings of ass. There can be no doubt that the tural schools throughout the country e more and more effect every year: ll turn out young men efficient and ined, who will, I am convinced, justify t architectural schools, and ultimately e country the better for their exist- As far as the Manchester School is d, I hope Mr. Cordingley is only the a long list of winners of the Rome hip, and that the city will benefit by ir work which the school undertakes.

g the last year there was the great tural controversy on the Registration posed by the late R.I.B.A. Council. as turned out *in toto* at the last elec- The Bill as proposed by the Council never have been approved by any nent, and the members of the R.I.B.A. ed very rightly that to put up a Bill sake of putting up a Bill—any old fact—was mere waste of time and of The new Council as elected last June osed of the leading members in the n, men of whom there can be no hat they are out solely for the good tecture and the good of the profession; re the management of the Institute's s safe in their hands. The great of registration is, however, still un- and it is up to the Council before next put a policy before the members. his policy will be I am not yet able you, but I can assure you that the uestion is being most thoroughly in- d, and that nothing will be done consultation of the members. It is a ficult question. Like Free Trade and n, there are many points for and As far as I am able to know the the members of this Society it is in registration, provided the interests Associate class are duly protected; whether this is the correct view to take or not, I am convinced it is the view of the majority of our members. I would, however, like to say on my own account that I do believe that registration is in the best interests of the profession, and not only of the profession, but of architecture and of the inhabitants of this country. It must mean in the long run the raising of the standard of work, and even if this is achieved at a possible temporary sacrifice, it will surely be worth while. In order to achieve it the profession, whether R.I.B.A. or otherwise, must be substantially solid in favour of it; what a difference it would have made had registration been put into action, say, twenty or thirty years ago. What a difference it will make to the country and to the profession ten, twenty, or thirty years hence! Some measure of sacrifice was required of the lawyers and of the doctors when these professions were made closed, but surely it has been worth while. Surely we are capable of doing what these men did before us. I repeat that the Associates, who have toiled for their examination results, must have their interests preserved, and I hope some way will be found to achieve this and yet to unite the profession.

Mr. C. McArthur Butler

(Secretary of the Society of Architects).

The Manchester Society has had under its consideration the question of local branches to the Society in neighbouring towns. Negotiations have already been opened with the Burnley Society, who are desirous of joining themselves to the Manchester Society. I think these branch societies are in every way desirable, as the more architects can keep in touch with each other the better for architecture, and that is our *raison d'être*. Branch societies might also be formed in various Lancashire towns; they would all be governed by the Manchester Society as regards professional practice, rules of competition, and so on. They would all have the benefit of the Societies' papers when they could come to Manchester, and also of the students' competitions, the library, and so on. If the Society does good work, the others would be infected by it. It is hoped, again, that the general standard of work would be raised by such unions.

From conversation with many members I think I am justified in saying that the profession is much busier than it was at this time last year: there are, of course, individual exceptions, and the prolonged slump in general trade must and does affect the profession very seriously. Still, I think the profession as a whole is fairly fortunate at the present time. Building is still very dear, but prices have come down very substantially, and it is doubtful whether they are likely to come down any more—at any rate, at present. It is up to architects, therefore, to study economy in building; no magical new methods of cheap building have come into being, so the task of cheapening rests with the architects, from whom the greatest skill is required in so designing that the most economical building possible can be achieved. Of the future I will not venture to prophesy: it is in the hands of the gods, and possibly of politicians.

The Manchester war memorial has had its foundation-stone laid; as you know, there have been many and troublesome battles before the performing of this ceremony. A competition was proposed, and indeed decided upon, but the committee could not bring itself to conform to the competition regulations of the R.I.B.A., which required the assessors' award to be final and binding; the net result was that the competition was washed out, and Sir Edwin Lutyens was appointed architect for the memorial. Everybody hopes that the memorial will be worthy of its great purpose: no better architect could have been appointed for the work.

I will just take this opportunity of impressing on members the importance of adherence to competition regulations. As long as all architects are loyal to their fellows—and as far as our members are concerned they certainly are—competitions will have to be conducted on the proper lines. This is one of the great points that would be attained by unification of the profession: all architects would then be brought into line and the best man would get his chance, as he does not always under present conditions.

THE SOCIETY OF ARCHITECTS.

The close of the Society of Architects' Session in October, 1923, coincided with the completion by Mr. C. McArthur Butler of his twenty-fifth consecutive year of office as Secretary. After being articled to the late Clapton C. Rolfe, A.R.I.B.A., of Oxford, and working as an assistant for other architects in various provincial centres, he was elected a member of the Society in 1894, and was engaged in practice as an architect when he took up his present appointment in 1898. Since 1898 membership of the Society has trebled; it has founded overseas branches; acquired permanent headquarters; extended its sphere of utility in many directions; and is continually finding new outlets for its energies without neglecting the main object for which it was founded, viz., the attainment of statutory registration of architects. Of late years a feature of the Society's work has been its support of the programme of the Beaux Arts Committee and other educational bodies, and its foundation of architectural scholarships at home and abroad.

Mr. Butler, who numbers amongst his qualifications that of a Chartered Secretary, frequently represents the Society on conferences and committees dealing with matters connected with the profession and the building industry, and is an original member of the Beaux Arts Committee, of which he was for many years the Honorary Secretary, and also a member of the Executive Committee of the Architects' and Surveyors' Approved Society under the National Health Insurance Scheme. He took a prominent part in the deliberations of the Unification and Registration Committee, and at the request of the Chairman prepared the "federation" proposals as an alternative to the "absorption" scheme.

Mr. Butler is the author of a number of articles and papers on matters of professional interest, a frequent contributor to the Press, and for many years combined the editorship of the Society's *Journal* with his other duties.

During the war period (1914-18), Mr. Butler,

in addition to carrying on and extending the work of the Society of Architects under the difficulties and restrictions imposed by war conditions, gave his services in an honorary capacity to the profession and the community in other directions. He served on the Executive Committee of the Architects' War Committee, the Architects' Committee of the Professional Classes War Relief Council, the Joint Conference of Civic Surveys, and was joint Honorary Secretary of the Architects' Reorganisation Committee and a member of the Architects' Demobilisation Committee. Mr. Butler takes an active share in the work of County Societies in London, and was for some years Secretary of the Association of Men of Kent and Kentish Men, and was afterwards a member of the Council and served on the Committee of the Cumberland and Westmorland Association. He was admitted a Freeman of the City of London in 1907, and in the same year became a Founder and the first Senior Warden of the Society of Architects' Lodge of Freemasons, and after serving the office of Master was appointed Secretary, a position which he retains.

DOMESTIC & HISTORICAL ARCHITECTURE OF ENGLAND.

MR. ARTHUR STRATTON, F.R.I.B.A., Reader in Architecture at the University of London, has just returned from Holland where he has been lecturing to large audiences in Amsterdam and other centres on the historical and domestic architecture of England. The lectures dealt with the vernacular styles of house design in England during the Tudor and Stuart times, and more especially with the influences from other countries which tended in the sixteenth century to divert English builders from their traditional methods, and in the seventeenth century to bring about an entire change in building construction. The various influences emanating from Flanders and the Low Countries which resulted in the early Renaissance architecture of England were contrasted with the later influences from Italy and Holland which were more beneficial and led to the world Renaissance of the seventeenth and eighteenth centuries. Mr. Stratton emphasised the good influence of the brick architecture of Holland upon the so-called Georgian vernacular style in England, and aroused considerable interest among the Dutch architects who were closely following modern developments of house designing in England. He also availed himself of the opportunity to remind them of the excellence of house building in England all through the centuries, and our genius for seeking inspiration from various countries while retaining a national character of our own. The lecture was fully illustrated by means of lantern slides, and was very well received.

ALFRED BOSSOM TRAVELLING STUDENTSHIP

THE subject set by the jury for the R.I.B.A. Alfred Bossom Travelling Studentship is as follows :—

A company is formed for the purpose of developing an island site 150 ft. by 100 ft. in the business quarter of a first-class provincial town of not less than 400,000 inhabitants. The student is required to name the town and the position of the site and to submit a scheme as architect to the Company which complies with the following conditions :—

(*a*) He is to state the annual value of the site.

(*b*) The property is to be developed to the best advantage, say, as a store, shop, offices, bank, &c., and the capital expended must be such as with its revenue will appeal to the public under current conditions. The capitalisation of the company being stated in outline.

(*c*) Local rates to be stated.

(*d*) The height is to be left to the student, but is not to exceed 100 ft. to the springing of the roof ; but there may be two floors in the roof.

(*e*) The Model By-laws of the Ministry of Health or similar enactment must be assumed.

(*f*) Promotion and legal expenses to be estimated at £2,000.

(*g*) Central heating must be provided.

The scale of plans, elevations and sections is to be 1-16 in. to 1 ft. No perspective drawing will be allowed, and no repetition of plans or elevations is required. Drawings may be lightly tinted in monochrome. The report accompanying the plans must deal with the approximate cost of building and the financial return of the whole scheme.

Associates of the Royal Institute who have not passed through one of the schools included in the competition are required to deliver their designs and reports (in competition for a Silver Medal) at the Royal Institute not later than December 1. Schools of Architecture included in the competition are required to announce that December 1 is the closing date for the local Silver Medal Competitions. The Silver Medal designs and reports must be submitted to the Royal Institute not later than December 31.

In the case of schools not recognised for exemption from the R.I.B.A. Final Examination, the local award of a Silver Medal is subject to the approval of the jury for the Gold Medal and Studentship.

HEALTH AND THE BUILDING.

IN his Second Chadwick Public Lecture on "Hygiene and Architecture," given at the Society of Arts on November 16, Major Harry Barnes, F.R.I.B.A., said he used the term "building" in the widest and most comprehensive sense to include all those matters of construction which turned the countryside into the town under the heads, "Where to build," "What to build," "How to build," although perhaps the most important consideration was outside the scope of the lecture, and that was "When to build."

There were not many chances of selecting the sites of new towns in this country ; in that respect America had the advantage of us. Sites of towns were determined in old days by strategic, defensive and military considerations. In these days a railway junction or coal deposit was a more determining factor. In most cases, however, the main considerations were geographical and geological. Sites being selected, the consideration of how to lay out a town led directly to zoning.

After discussing American and British views on zoning, the lecturer passed to the question of roads. He concurred in the views expressed by Sir Henry Maybury that more good could be done by laying down entirely new roads than by conducting surgical operations on the old ones. The aim should be not to see how much traffic could be forced through an ancient centre, but how much could be deflected to roomier channels. He never looked at an old map of London without thinking what a pity it was that the old villages, which had grown into the London boroughs, had not been preserved, and the extension of London taken place on the land between them. He expressed the hope that the new road developments might spare the old villages and towns, which should lay off the new high roads so that those who had no interest in them need not pass through them to the discomfort of those who had. He pleaded for a land in which not only the business man was provided for, but where the loiterer might find a place.

Concluding with a reference to the relationship between hygiene and the building itself, the lecturer said the main problem in connection with buildings was that of smoke abatement. Hygiene had won notable triumphs from the land and in the water, by the removal of refuse and the prevention of the pollution of streams ; it remained now to achieve its final victory in the air. The pollution of the air was responsible for respiratory diseases, an increase in the death-rate, especially amongst children, loss of sunshine, damage to vegetation and build for waste amounting to millions of Hygiene cleansed our rivers, and we n cleanse the air. That was the great which hygienists and architects might solve.

EXHIBITION NOT

CAMERA CLUB.

FEW people realise what an immense d it would make to us all if we saw thin camera presents them. Our eyes f some point and within a small distanc our vision is clear and defined ; beyond vision gets gradually blurred into notl People who criticise the looseness and v of an artist's handling in the nearer po his sketch forget this ; they fail to rea this treatment is the nearest approac actual sensation of sight. Those wh stand this cardinal fact about vision i increasing interest in the work of thos graphers who have compelled their wo recognition, and we now constantly important photographic exhibitions m examples of artistic triumph over m process. We cannot complain if thr medium of photography the artistic produces beautiful results, but it is w reminded where the skill of the artist In the exhibition of pictorial photog the Camera Club by Mr. Jas. MacKissac not merely the evidence of a skilled t but the eye of an artist who gives som the distinction of an artist's drawing and varied subjects. A patch of bare v tree branches, a cathedral, or a figu street corner come with equal force tinction in Mr. MacKissack's handlin camera, and it is a real pleasure to s he has done with the subjects now s the Camera Club, for his effects are excellent, but varied from grave to g broad, soft and rich tones to brilliant of bright sunshine and glittering detail whole the former effects predominate, is why the exhibition is so pleasant a

WALKER GALLERIES.

Amongst the quickly succeeding ex at the Walker Galleries we do not of one so full of freshness and charm as Capt. Morgan's water colours of Susse are some fifty drawings which really r water colour art, and which convey an sion of genuine individuality ; with colou of a bright and happy kind, erring ne richness nor insipidity—a picture of gre with a water foreground, an expanse of of pleasing gradations of purple and blu a dark-toned land—subjects of the kind bring pleasurable emotions fr artist's brush. Surely no one need be charming examples of water colour art these days in view of such an exhibition, the only criticism to be offered is th cheap and modern ! One almost wond a Sussex landowner or a Sussex muse not buy up the whole collection.

Two other exhibitions of interest at V Galleries are those by Lady Jephson a Hilda M. Sides, which both contain som handling if a little lacking in freed spontaneity.

FINE ART SOCIETY.

The wonderfully clever work of Mr. Flint at the Fine Art Society is assu perfect in its way. Though we may like the nude or half nude figure to be t point in a landscape or seascape, we deny the grace and light with which this figures seem to clothe the landscape i they appear. The picture of "June" i personification of light and air owing wonderful figure in the foregroun assured grace and ease of Mr. Russell work must make a strong appeal to the but it is, we suppose, a fact that som thankless public find even perfection cloying.

THE RENAISSANCE OF ROMAN ARCHITECTURE.*

Renaissance, that strange return of civilisation upon the art and learning rlier time and vanished race, affected ral peoples of Europe more or less ly according to their national char- s and to their physical nearness to es of the movement in Florence and . The enthusiasm for the revival of may have been as intense in France land as it was in the native city of gelo, but the opportunities for direct Roman buildings were limited in and practically non-existent in Eng- t is matter for little surprise, there- t the architecture of the Renaissance e differs very considerably from that or that its manifestation in England nclude features unknown in France. an be no doubt, however, that the s and students sincerely believed that e working along the lines laid down nighty Romans, and that they were g for the world an inestimable trea- ublishing so much antique regularity ty.

omas Graham Jackson's third volume Renaissance of Roman Architecture e course of the movement in France, om first to last a distinctly French thought unconsciously modified the f imitation of the antique. Of the riod Sir Thomas writes: "And yet ons of art at the beginning of the century, while they were only trim- eir Gothic buildings with scraps of rnament, seem to have thought they ght the true spirit of the Renaissance. ffroy Tory, indeed, boldly claims that ch had surpassed their teachers and dels. In the preface in his edition of book *de re* Œdificatoria, published he says: 'Our ancestors, as every- ows, were content with good work, t with little art and elegance. . . . length we have woken up, and our s are now renowned everywhere. since that magnanimous king, the all Italy, Charles VIII, returned as us conqueror from Naples, the art of in the beautiful Doric and Ionic hich is also that of Italy, has begun ractised among us with great success. u may see, I say, buildings so beauti- so perfect that the French architects ged to surpass not only the Italians, r teachers, the Dorians and Ionians.'"

rtists of the Renaissance seem to have an atmosphere highly charged with of the solemnity and importance of unctions as purveyors of the true manner, and popular approval, blind humorous side of this pompous stand- onfirmed the artists' estimate. It was the alert mind of a Shakespeare that squerade appeared in its true light. an actor, Shakespeare knew the of make-believe, and amused himself s audience with more than one com- upon this Classic play-acting taking eriously. But if the early Renaissance ce differs obviously from that of Italy ll more from the Roman works, the ork still betrays the admixture of feeling with the Classic tradition. tstanding perfection of French mason- ffected the growth of the new style just ad permitted of the development of a s style of Gothic, in which the scien- onomy of material had been carried to es.

re the Italian buildings were often con- d of brick and stucco without any structural emphasis, the French seldom allowed the imitation of antique form to obliterate this legitimate interest in construction. The famous external spiral staircase of Blois, illustrated in Plate VIII, indicates the mastery at an early period of all the intricacies of stone cutting applied to a design purposely composed to exploit them, together with the newly introduced Classic detail. The spirit of the work is Gothic and distinctly French, and this character was to persist even in later buildings, and despite the presence of Italian artists invited to the court of Francis I. The courage of these great masters in claiming to rival or surpass the works of antiquity is brought out in the account of Cellini's silver Jupiter retold in the book: "Another great Italian master, Benvenuto Cellini, arrived in 1540 and stayed in France till 1545. He produced many vases and figures for the King and a famous salt-cellar of gold, but made an enemy of Madame d'Etampes, the King's mistress. He fell out also with Primaticcio, whom he threatened to murder, and after a stormy career escaped to Italy, throwing up his commissions. . . . He tells an amusing story of triumph over his enemy, Madame d'Etampes, who made him produce his silver statue of Jupiter in the Great Gallery, where she had assembled all the casts from the antique in order to put his work to shame; but by a trick of lighting he showed up his statue to such advantage that the King said whoever made this arrangement has done Benvenuto a great favour, for his works not only bear comparison with the antiques, but surpass them."

The French people did not take kindly to foreign artists, and though at a later date Bernini was expressly invited to Paris to design the new buildings of the Louvre, the work was ultimately given to Claude Perrault, through the astute wire-pulling of his brother Charles and Colbert, whose management of the King (Louis XIV) was as brilliantly successful as it was unscrupulous. Bernini returned to Italy enriched with presents, but disgusted with his treatment as an architect, since his magnificent scheme had hardly been considered for a moment. To this day the term Italian is used among French architects to denote an irregular mode of design not worthy to be called French. Perrault's design for the Louvre was far nearer the Classic model in its splendid simplicity than most French work that had preceded it, and he abandoned one of the most persistent of French architectural features—the high-pitched roof. The masonic tradition, which had showed itself in *tours de force* of interesting detail at Blois and in the works of Philibert de l'Orme, reappeared in the Louvre in the use of enormous blocks of stone, recalling the veritably megalithic buildings of antiquity. The tympanum and sloping cornices of the central pediment were so huge as to demand special contrivances for raising them to their positions in the building. The construction has not the directness and simplicity of the old post and beam arrangement of Classic times, however, for the entablatures are composed as flat arches, and not as lintels.

Masonic skill and the pride of the purist in Classic style reappear in the famous church of S. Genevieve, now better known as the French Pantheon, and inscribed to the memory of the great men of France. If in the early days of the Renaissance the difference between the local work and the ancient model had been obvious at a glance, the difference still exists in this beautiful building, designed in the light of personal study of the antique by one of the ablest of French architects, Jacques Germain Soufflot. It is known that the design was inspired by the intention to build in accordance with reason and with the purest Classic models, but the legacy of Gothic times, manifesting itself in over-daring economy of support beneath the central dome, introduces a feeling of lightness totally foreign to the aspect presented by antique buildings, where scientific economy of abutments was so well disguised under the surface treatment of colour and coffering as to reveal itself only to serious study.

Encouraged, perhaps, by the precedent established in England a century before by Sir Christopher Wren, who had recommended scientific economy in construction both in his writings and in his executed work, Soufflot set himself to produce in stone a masterpiece of delicacy and good proportion.

The load of the central dome is borne by four triangular piers originally planned to line with the columns of the nave, but strengthened since the erection of the building with added pilaster strips when cracks in the masonry demonstrated the insufficiency of material to resist the stresses imparted by the load and wind pressure of the high dome.

The vaulting is freely pierced with interpenetrating barrels, and appears almost unreasonably fragile in respect of its own internal thrusts, without taking into account the disturbance due to the unequal loading on certain parts occasioned by the pressures from the central pile of drum and dome. As Sir Thomas writes, "the four great arches that carry the drum seem perilously weakened by being pierced with openings at their springing." In criticising the external appearance of the church he compares the dome with those of the great cathedral churches of London and Rome, and finds the French building less pleasing in its arrangement. "The drum is surrounded by an evenly spaced colonnade, with no breaks and no connection with the solid structure within it. At St. Peter's, St. Paul's, and the other great domes in Paris this is not so, but the colonnade breaks back at intervals to form buttresses to the walls of the drum, with a satisfactory effect both æsthetic and constructional. At the Pantheon the colonnade is useless, a mere screen, a sort of fender slipped over the drum, an unreality and meaningless, a mere piece of pictorial architecture. As one looks at it one can even see the light through the colonnade at the sides." The author does not go on to state, as he might have done, that this external drum and colonnade are supported by four colossal relieving arches spanning respectively the whole breadth of the church and transepts, and which are buttressed by the great external walls of the building, whose height and severe plainness he has just commented upon.

Notwithstanding the many excellent books that have been written upon the subject, Sir Thomas Graham Jackson's work makes its own appeal as a concise and eminently readable work. The illustrations are clear, and those reproduced from the sketches of the author and his son are of interest also as examples of faithful delineation in pencil and in colour.

The printing of the colour plates, always a difficult and anxious matter, has been markedly successful.

* Sir Thomas Graham Jackson, Bart., R.A. II: France. (Cambridge: University Press. 2s. net.)

An Ancient Castle.

The historic border stronghold, Croft Castle, Herefordshire, with 500 acres of surrounding lands, has been purchased by the trustees of Sir James Croft. The property thus goes back after a lapse of nearly two centuries to the family that had owned it from the time of Edward the Confessor until 1730. In 1730 the Castle, with the estate, was sold to Richard Knight; the next owner was Thomas Johns, the translator of Froissart's Chronicles, and then it went to Mr. Somerset Davies, M.P. for Ludlow, by whom it was largely rebuilt.

THE WEEK IN PARLIAMENT.

WESTMINSTER.

Sanction for Schemes.

Mr. Trevelyan Thomson asked the Minister of Health whether any schemes submitted to his department for the erection of houses by local authorities under the subsidy provided by the Housing, &c., Act, 1923, had not been sanctioned; and, if so, what were the reasons for such refusals?

Lord E. Percy, Parliamentary Secretary to the Ministry, said that approval to proposals for building by local authorities had generally been given for such number of houses as would be rapidly completed by the building labour available in the district. In a number of cases it had been necessary, in view of the amount of work in hand or the lack of essential skilled labour, to limit immediate approval to an instalment of the local authority's proposal, the principle being to get houses actually built and occupied as quickly as possible.

Grants for Slum Clearances.

Replying to Mr. Gilbert, Lord E. Percy said that 86 local authorities were undertaking, or had under consideration, schemes for the improvement of slum areas, and the annual Exchequer contribution towards the losses on these schemes would be approximately £127,000. The largest contribution would be made in the case of the London County Council, who contemplated schemes involving a total annual loss of £100,000, of which half would fall on the Exchequer. A number of those schemes had already been confirmed. Schemes of considerable magnitude were also proposed by a number of the more important county boroughs, notably Liverpool and Manchester.

Schemes Approved.

Replying to a number of questions, Sir Wm. Joynson Hicks said that 57,830 houses were provided for in schemes approved under the Housing, &c., Act, 1923, and of these 26,705 were to be erected by local authorities and 31,125 by private enterprise. Under the Housing, Town-Planning, &c., Act, 1919, 9,082 houses were either in course of construction or had not yet been commenced. According to estimates based on returns from local authorities there were, in addition to this, not less than 36,000 houses in course of construction under the new Act, for which no subsidy would be payable, from which it appeared that private enterprise was fulfilling its proper duty. The total number of houses in course of construction on September 30 last was over 50,000. He had had to defer approval of many houses on account of the scarcity of building labour, but he confidently anticipated that the number of houses of all kinds built within 12 months of the passing of the new Act would, nevertheless, approach 100,000, which was greater than any number since 1909. 9,756 houses were included in schemes of Rural District Councils which had been approved under the new Act.

The Subsidy.

Replying to Mr. McEntee and others, Sir Wm. Joynson-Hicks said that, where a local authority obtained approval of a scheme for granting assistance to private enterprise in anticipation of the passing of the Housing Bill, and in pursuance of that scheme had undertaken to give assistance, any houses to which such undertakings applied would by virtue of Section 2 of the Housing Act be eligible for grant. He had also undertaken where assurances had been given by or on behalf of local authorities, on the faith of which builders had proceeded with building, in anticipation of the approval of a scheme for assisting private enterprise, to pay the equivalent of the Government grant under the Act in respect of houses which would otherwise be eligible for assistance. Houses, the construction of which was begun in the absence of any such assurance, would not be eligible for assistance.

Inhabited House Duty.

Lt.-Col. Guinness (Financial Secretary to the Treasury), informed Mr. D. G. Somerville that the collection of Inhabited House Duty on the new scale would not commence until next month.

The Dissolution.

Parliament was dissolved on November 16.

BRISTOL HOUSING.

THE letter on the subject of the housing shortage by Councillor F. E. White, of the Building Operatives' Union, published in the Bristol papers, has elicited a reply from Mr. A. Pitt, Secretary of the Bristol Association of Building Trades' Employers, who says that in connection with the statement that by the adoption of the scheme of direct labour more houses would have been built, and a saving effected, there are one or two points that should be ventilated. Houses were erected by direct labour, and, according to a statement made by the responsible city official, a saving of £23 per house effected. But in arriving at this figure no addition was made for establishment or overhead charges. Such charges on a house costing in the neighbourhood of £800 would be considerably in excess of the amount of the alleged saving, so that far from any relief of rents or rates being effected the houses built by direct labour actually cost the ratepayers more than those erected by the building contractors. Direct labour had its opportunity in the building guilds, but was found wanting. The guilds paid a few shillings in the £, and left their contracts, running into an immense amount of money, to be finished by the contractors they were designed to do without.

Mr. Pitt says that the members of his Association, realising the urgency of the demand for houses, undertook to build any number in the city, and were willing to erect on a basis of 7½ per cent. above actual cost, this to include both profit and overhead and establishment charges. Many prominent and responsible members of the Association are still willing to undertake the work upon this basis, provided they have the whole-hearted co-operation of labour.

Mr. Pitt goes on to say that it is suggested that if concerted action could be taken with a view to securing the necessary supplies of materials for housing purposes upon equally advantageous terms, the cost of houses to the city could be brought to an irreducible minimum. To solve the problem needs the co-operation of all parties concerned—the builders, the merchants, and the operatives—but there must be a distinct understanding that no attempt will be made to inflate the rate of wages paid upon such work beyond the standard laid down by national agreement. This more than any other cause has been the reason of any diffidence shown by builders to undertake the erection of small houses upon the scale which the demand necessitates, and the action of the operatives in this direction has been largely responsible for the position that Councillor White suggests when he states that only the better class properties, for people who can afford to purchase, are being erected.

In dealing with the supply of skilled labour, Mr. Pitt says that there is room in the city for a greatly increased number of bricklayers and plasterers. Speaking from the employers' point of view, it is a fact that many contracts are being withheld simply for this reason, and the anomaly exists of every skilled man being fully employed while the building industry of the city is by no means fully extended. Mr. Pitt mentions that the Unions strenuously opposed the Government scheme for absorption of 50,000 able-bodied ex-Service men, up to the age of 30, into the trade, neither would they agree to the promotion of semi-skilled builders' labourers to the ranks of the skilled artisans, thus making room for ex-Service men in the industry as labourers. Several members of the Association were willing to promote some of their labourers in this manner, and pay them full craftsmen's wages, but were prevented from so doing by the of the Trade Union members, who refu work with them. This notwithstandin prior to the war the principal recruiting r bricklayers and plasterers was from the la employed by speculating builders.

Mr. Pitt concludes his letter with the co that enough has been said to lay befo public both points of view. No progress made by a policy of recrimination, employers and employees are prepared operate in an honest endeavour to secu erection of the houses so urgently neede the authorities are prepared to enterta proposals, a solution of the housing p should not be outside the range of possibi

RENAISSANCE TOW PLANNING.

THE fifth of the series of lectures on Planning, given by Mr. William Ha F.R.I.B..A., at Birmingham University entitled "Renaissance Town Planning," course of which the lecturer said the earlie tributions of the Renaissance to town pl appeared in the geometrical association o palaces and mansions with their imm environment. In towns, great building placed as the culminating features of squares, with which they were design balanced composition. On the outski cities, or beyond their boundaries, these settings were frequently extended over g of gigantic scale, with a free display o feeling for comprehensive planning whic so characteristic a feature of the period.

Churches also were designed with a environment, notably St. Peters, whic associated with the magnificent atriu colonnaded piazza built by Bernini in A contemporary design by Carlo Fontan prolonging the axial composition of the to the Tiber by an adjustment of the p road approaches, also illustrated the tre Renaissance ideals.

It was natural to compare the several fe of the Vatican group with those of t fora of the Empire. In both there wa great colonnaded piazza or Forum, wit church—or its equivalent temple—on the axis; and the same absence of concern medley of neighbouring streets; whil palace of the Popes stood in relation t stately planning below, much as the pala the Cæsars stood on the Palatine above t fora. St. Paul's, London, might be quo having about it the slight remains Christopher Wren's great scheme of 1666, to a large extent, was pivotted on the cath

It was chiefly to Pope Sixtus V (15 that Rome owes its present aspect. He re the water supply and so made habitable areas of the higher town which had lain since the aqueducts were destroyed directed his architect, Fontana, to plan roads for the development of these aban areas; and for the first time in history appeared certain elements of planning for which were conceived in a manner suit modern needs.

The Piazza del Popolo was the chief fe of Fontana's scheme of roads. It was asso with the northern gate of the city walls. outside the walls—with the Via Flamini old military road to Rimini. Three arteries diverged from the piazza to widely separated sections of the town, j roads entering a great city should do indeed, as roads should diverge from any of traffic concentration, whether it w bridge head or that modern equivalent f old city gate, a railway terminus.

The Piazza del Popolo was essentially a centre, and as such it initiated a new u public squares, which from this time on tended more and more to abandon the and more exclusive character which was in the Place Royale, Paris, 1600, and the Vendôme (as originally planned about 170

THE BUILDING TRADE.

THE COST OF BUILDING.

By T. P. BENNETT, F.R.I.B.A., Hon. F.I.O.B.

s certain that there has never been a
the history of building when cost was
l as it is at the present moment. Not
re building prices abnormally high (as
other prices), but owing to the ever-
possibility of further variations and
fact that building means the outlay
substantial amount of capital, every
g owner feels anxious about laying out
ney. These factors make it incumbent
everyone connected with building to
prices to a minimum, a necessity
on account of limited possibilities, is
cute in housing than in any other class
ding. Designs, therefore, must include
bsolute necessities. Planning must be
e and economical as possible, specifica-
nust be worded with extreme care, lest
ne means a clause may be interpreted
er an unexpected and unwanted outlay.
may well be differences of opinion
the irreducible minimum of accommo-
and while all public-minded men wish
se the population as well as possible,
realise that there are monetary limits
cannot be passed without disastrous
al consequences. On the other hand,
al housing enthusiasts have endea-
to use a large variety of semi-per-
t materials solely because of their com-
ely low initial cost. They have sung the
of timber construction, and even corru-
iron and matchboards. This welter of
suggests that such materials have never
been tested, that there is no real reason
und building, and that any gimcrack
ire which can show a low erection price
e welcomed with open arms. Such an
le is as insidious as it is fallacious.
ood enthusiasts must be reminded that
ire of London in 1666 was largely the
of timber buildings, that all collections
nber houses are potentially open to
ction by fire, and that there are very
cal reasons for erecting fireproof houses.
r is also liable to decay, is expensive
intain, and by reason of the spaces
en the supports in a cheap structure it
le to harbour vermin. Corrugated iron
ther purely temporary materials, besides
high cost of maintenance, are generally
ntly, and in initial outlay do not save
ent to compensate for these defects.
cost of housing, therefore, first resolves
into the necessity for striking a balance
en the qualities of permanence, low
enance, and attractive appearance with
ital expenditure which is within the
s of the majority of the working mem-
of the population. This is the problem

prize money in both competitions, an analysis of a large number of prices for typical small houses is therefore possible, and by this analysis more accurate information should be obtainable about cost than has yet previously been available. If this information can be presented in a concise form and in such detail that it indicates clearly the direction in which expenditure occurs, it will be invaluable to architects and housing authorities, and will be a permanent guide to the erection of economical buildings, and should indicate the limits of cost imposed by permanent brick structures.

The analysis which is now being made will, therefore, commence with a comparison of the area of stairs and passages with the effective areas of rooms, and of the latter with the length of walls needed for their enclosure. By this rough guide it will be possible to see how far the designs themselves are economical. The specification as embodied in the quantities will next come under general review, and later will be subject to comment by builders in various parts of the country, so that local practice and experience can be collected for the common information of all engaged in housing. By this inquiry amongst builders many details will be discussed which may perhaps yield valuable results. All architects and builders, whether they took part in the competition or not, are invited to give their comments and opinions, and all opinions which are of sufficient interest will be incorporated in these articles. It is impossible to over-estimate the value of such collective knowledge and experience. The priced bills of quantities which have been received in the competition provide much that is of value, one of the most important features being the proportion of the total cost which is absorbed by each individual trade—*i.e.*, bricklayer, drainage, carpenter and joiner, plasterer, plumber, etc. By plotting graphs showing these amounts, their relation to the whole will be seen at a glance, and the main sources of expenditure having thus become evident, it should be possible to watch these items in future schemes. Individual items in many cases are most illuminating, likewise the prices given by different competitors for the same work. Such items as excavation, wheel and deposit, concrete in foundations, tile roofing, treads and risers, casement sashes and frames, lath and plaster on ceilings, knot, prime, stop and paint three coats, etc., will appear under this heading.

The detailed examination of the cost of materials will next claim attention. Materials may be expected to vary, owing to efficiency in buying, to expert knowledge of markets, to the locality, transport, and other matters, and a study of these variations, with perhaps some published prices, should be of immense value, especially if they indicate that some channels of supply are unmistakably cheaper than others. A chart of these variations will be given. Prices per ft. cube and per ft. superficial of floor area are valuable to the architect, and when these are sub-divided into trades or portions of trades they may help to provide a more accurate means of estimating than is the case with ft. cube estimates without the help of such sub-divisions. The dissection of the structural item is a further point which will add to present knowledge, so that it should be possible to say that houses such as those under discussion could be built as barn-like structures, without facings, skirtings or any amenities whatsoever will cost a certain lump sum and a certain price per ft. cube. The architect and building owner by this means will know the minimum cost of the shell of the structure, and by the exercise of intelligent knowledge and judgment will be able to decide upon the amount of enrichment that is permissible or which has been added, and so may know what they should pay for completed houses. Labour rates may next be examined, or at least referred to, as there is considerable variation in different parts of the country, and also because, as is well known, the best and most enterprising craftsmen tend to migrate to the larger towns and London.

Finally, there is the question of the extent to which extraneous and apparently irrelevant matters affect the cost. Under such headings are (1) the existence of an architect, and (2) the existence of a bill of quantities. There seems little doubt that in country districts builders fear that the architect will demand an unreasonable amount of finish, and will delay the work while making decision and supplying details, or will in other ways increase the cost, and that tenders will in consequence be higher. The bill of quantities, with its multitudinous detail, has similarly an effect upon small builders, and causes them to increase their tenders, partly because they fear its rigidity of detail, and partly because they are not in the habit of dissecting their prices so finely, and consequently price the items inaccurately. Wide variations are found in the cost of individual items and in the total amounts of the tenders submitted. In some cases these variations are understandable, but in general their amount is inexplicable. It is not too much to say that such large differences in price should be impossible when dealing with a perfectly straightforward pair of houses supported by an accurate bill of quantities. These big variations can presumably arise only from inaccurate knowledge, inability to dissect prices, or to quite abnormal local conditions. If every estimator had the amount of knowledge of his job that he should have, and if materials were of average prices, the amount of difference in the tenders should be less than half as much as it is. It may be that examination of these tenders will show where some of these great fluctuations exist, and if this should prove to be the case, and the disparity were only partly removed in future work, the result would be of extreme benefit to the industry and to individual builders and architects. It is, of course, evident that a certain amount of variation will always exist owing to the difference in the standard of workmanship which is put into the work. The acceptance of a standard lower than the best must remain a matter of judgment, but there is no doubt that a lower standard is possible in small houses than in large West-end buildings. It is, and will remain, a matter of difficulty to define an acceptable standard, and almost inevitably this becomes a matter of practice between the architect or building owner, and the individual builders who are asked to tender. It is beyond question that more accurate methods are necessary in every department of building, and that technical education and the stern necessities of high building costs and fluctuating prices are bringing these methods into existence. A competition of the kind now under discussion and analysis does much to draw the attention of the industry to these matters and to elucidate them. It is impossible to set too high a value upon such a competition, or to stress too much the need for careful and accurate work and the extension of the knowledge of the industry of the cost of modern building. This extension of knowledge has a twofold object. (1) It enables the architect to estimate closely and the builder to tender accurately, and thereby avoids difficulties for the former and bankruptcy for the latter. (2) It increases the confidence of the public in build-

ing and in architects and builders. Confidence creates work, because even if prices are high the client will often build if he feels that they are accurate and reasonable, and that he has not been misled by false information or lack of ability. The one important item that cannot be accurately shown by figures, or even accurately gauged by the builder, is the output of the operatives. All who have had charge of building must at times have been exasperated by the conversational habits and general slackness of many of the so-called skilled men who are employed. They must similarly have deplored the inability of the builder suitably to reward the really industrious workman. At times it almost seems as if the indolent flourish, and gain the rewards intended for their more conscientious colleagues. These articles are, however, an attempt to analyse cost, and the only excuse for a passing reference to output is its influence on cost and the indefinite value which must be assigned to it. Cost is also affected by work which, by its unusual or restrictive nature, absorbs an abnormal amount of labour. Such conditions cannot, however, be said to exist in the houses under discussion, and the matter is therefore left with only a passing reference. It is evident that in a subject so large, and attending which there are so many contingencies, finality can hardly be reached, but it is equally certain that much can be done to throw light upon a difficult matter, and that the competition may have very valuable results in this direction.

BUILDING MATERIALS MADE OF WASTE MATERIALS.

THE last of a series of lectures by Professor A. P. Laurie, Professor of Chemistry to the Royal Academy, was given at the Royal Academy of Arts on November 21.

In the course of his lecture Professor Laurie stated that he originally intended to confine his lecture to the subject of the title, but he found himself drawn into dealing with the whole matter in a wider aspect. We had in this country large accumulations of blast-furnace slag, cinders, clinker, and, in the neighbourhood of Edinburgh, of burnt shale, the residue from the stills of the oil industry. There were three ways in which these materials might be utilised: for the production of bricks, for the production of cement, and as aggregate mixed with Portland cement or plaster of Paris. The general method adopted for the production of bricks was known as the sand lime process, because in the first instance it had been applied to the manufacture of bricks from sand. Briefly, this process consisted of mixing the aggregate with a certain proportion of lime and water, squeezing it into a brick under very heavy pressure of some two hundred tons to the area of the brick, and then steaming under high pressure or in open steaming chambers. Bricks were now being manufactured by this process from sand, blast-furnace slag—granulated by being run while hot into water—clinker, town refuse, slate dust, and burnt shale. Cement was being manufactured by two of the Scottish steel companies from blast-furnace slag, granulated, mixed with lime, and then raised to a high temperature, so as to form a clinker in the same way as ordinary Portland cement was manufactured. This cement, known in Germany as iron cement, could be sold in this condition, or could be finally ground with a mixture of a certain proportion of raw blast-furnace slag. In addition, Professor Laurie made the suggestion to the Board of Scientific and Industrial Research, which has been followed up, with the result that they were of opinion that a very useful cement could be made of the burnt shale of the Scottish oil-shale dumps by merely grounding with a certain proportion of slaked lime. The uses of these materials as an aggregate opened up the question of how far it was possible to reduce the content of Portland cement and, at the same time, get sufficient strength for building purposes. The objection to the usual building slab made of cement was that in order to remove it from the machine as soon as made the content of water had to be kept low, and, consequently, the crushing strength of the finished slab was also low. Two interesting methods of getting over this difficulty had recently been brought to his notice: one, the Crozite method, by which the cement bricks were sliced off from the bottom of a column of cement and aggregate; and the other, the method of the Triangular Construction Company, in which a heavy compression was put upon the bottom and top of the slab at the moment of completion. It had been possible in the case of the slabs made by the Triangular Construction Company to reduce the amount of cement to one to twelve of aggregate by their method of manufacture, and the manufacture of cement bricks by the Crozite process was being carried on on a large scale in America.

The lecturer, having illustrated the Crozite method of manufacture by means of slides, proceeded to say that it might seem out of place to introduce the subject of plaster of Paris into a lecture on waste materials, but the building industry was confined in practice to two cementing materials—Portland cement and similar preparations, and plaster of Paris—and many waste products, such as sawdust, disintegrated wood, and ordinary cheap aggregates, such as clinker, could be utilised in slabs made from plaster of Paris. We had large and easily available deposits of gypsum in this country, but the industry had never been developed on the enormous scale which was found in America, and in which all kinds of materials required by the builder had been turned out made from plaster of Paris as the cement. This was due to the adoption in America of up-to-date methods of mining, of handling, and of heating the raw gypsum.

In conclusion, the lecturer expressed his thanks to Mr. Weller, of the Department of Scientific and Industrial Research, for his assistance in getting information for this lecture.

RENT INCREASE.

A VERY important decision has recently been given in the case Bourne *v.* Litton (*Weekly Notes*, November 10). The plaintiff was seeking to obtain possession of his house on the ground that certain sums due for rent had not been paid. He had purchased the property by contract on July 27, 1920, and under that contract it had been assigned to him on August 8, 1922. The defendant had been the tenant of his predecessor in title, and the agreement under which she held would terminate on September 29, 1922. On August 24, 1922, after the property had been assigned to him, the plaintiff had given the defendant notices of increased rent claiming 15 per cent. under section 2, subsection (1) (*c*), and an increase of 15 per cent. under paragraph (*d*). That paragraph provides as to increases of rent: "In further addition to any such amounts as aforesaid (*i*) where the landlord is responsible for the whole of the repairs an amount not exceeding 25 per cent. of the net rent, or (*ii*) where the landlord is responsible for part and not the whole of the repairs such lesser amount as may be agreed, or, as may, on the application of the landlord or the tenant, be determined by the County Court to be fair and reasonable having regard to such liability." By the agreement of tenancy the defendant, the tenant, had to keep all gutters, stack pipes, water-closets, gullies and cisterns clean and in good sanitary condition, and to keep in repair all window glass, sash lines, and internal taps and pipes, and also to maintain and keep in repair all venetian and other blinds.

The defence to the claim for possession was that as the landlord was not responsible for the whole of the repairs, the amount claimed for rent was in excess of that permitted by the Act, and it was contended that the notice was invalid because under paragraph (*d*) there was no agreement as to the amou which the landlord was entitled to inc the rent and in default of agreement n termination by the County Court of amount.

The plaintiff relied upon certain corres ence which had passed between the soli of the parties which it was alleged amo to an agreement of the amount at 1 cent. under paragraph (*d*).

The Court held that a landlord who responsible for only part of the repairs not entitled to serve a notice of increase paragraph (*d*) until the amount he wa titled to claim had either been determine agreement, or by the County Court in d of agreement, and that as in this case a date the notice of increase was served had been neither an agreement nor a termination of the amount by the C Court the notice was invalid, and tha agreement between the parties after the was served did not make the notice therefore, even if the correspondence ref to did constitute an agreement the notice invalid, and judgment was given for d dant.

Every decision under the Rent Acts s to open up a new vista for litigation. the present decision shows that nice tions may arise as to what is intended b expression, "the whole of the repairs." this case the repairs to be undertaken b defendant were internal repairs of a small description, such as might well be posed on the tenant even under a leas which the landlord practically was res sible for repairs in the general acceptan the word, and thus the question arise what extent trifling repairs placed upon tenant will operate under the above graph? Apart from the window glass, repairs in this case seem limited to would be fittings and fixtures, but no tion seems to have been raised as to nature of the repairs. If one small which can be deemed repair is to fall o tenant it appears it may be argued tha landlord is not responsible for "the wh and before he can give a notice of increas must in default of agreement bring the m before a County Court or he may run the of his notice being held invalid and his ceedings for possession based upon it dismissed with costs. It really is small der that houses are no longer offered on while the two-edged sword of the law is suspended in this manner over the hea landlords, but the Legislature seems blin the effects of such legislation. Burdens gri to be borne have been laid upon the shou of landlords to such an extent that the le or letting of houses has become extinct. well-tried and convenient relationship of lord and tenant has been extinguis houses free from rent restriction only offered for sale, and no house once got o the meshes of rent restriction is ever of on an agreement or lease again. So inte the Legislature on rent restriction that it not see that the letting of houses has restricted out of existence and that the profiteering is taking place in connection the sale of houses in a market restricte the Legislature in the sole interest of si tenants. The landlords of houses alread are brought before the Courts over the plest matters by statutory tenants, and an increase in rent under the Acts is he round with legal technicalities. This offers one more example of this—for a lord must consult a Court before he can an increase of rent under paragraph (*d*) less he can come to an agreement the tenant, and if the tenant is a "s tory" tenant he will not be willin agree any matter; besides this, it ap that in every case where the lan claims an increase in rent over and the increases permitted by the preceding graphs of this subsection, he may be m the allegation that some trifling repair u taken by the tenant brings him under second head of the paragraph as not re sible for the whole of the repairs.

THE HEATING OF BUILDINGS.

November 15 Mr. F. Broadhurst Craig ed before the Northern Polytechnic on ting Systems Used in Buildings."

the course of his remarks he said a good of uncertainty undoubtedly existed as to spective merits and demerits of the different ds of heating buildings, and to his mind the n's difficulty was in discriminating between laims of the exponents of the various ns. Broadly speaking, heating systems be divided into two distinct classes. there were those intended for inter- t or occasional use; and second, those of inuous nature.

the first category might be placed open slow combustion stoves, gas heating atus (including gas fires or gas grates, gas ors, and gas-heated boilers or geysers), c radiators, and oil stoves. All these nces had their own specific uses, but their yment should be limited to small-roomed nces and offices in which occasional heating vas required. The attempt to warm the rooms of even a moderate-size building by these means was almost certain to result ure, either on the score of inadequacy or sed working costs.

ordinary brightly burning open fire would pproximately 3,500 to 4,000 B.T.U.'s per ft. of fire surface, and to maintain this 3 to 3½ lbs. of fuel required to be burnt our. Assuming that the coal had a c value of 13,000 B.T.U.'s per lb., this n efficiency of $\frac{13,000}{4,000} \frac{3.5}{100} = 11$ % only.

t altogether from the exceedingly low cy of the open fire, it possessed other antages. One of them was the amount it created and the consequent deleterious upon decorations and furnishings; and r was the disagreeably cold air currents it set up from the windows and doors s the fire. In fact, the area of t in most large rooms was appreciably l in the winter for this reason. Slow stion stoves had an efficiency of 5 to 40 per cent. The surface tem- e of the stove was usually from 300 degrees, and this would transmit imately 800 B.T.U.'s per sq. ft. of outer The manufacturers of these appliances specified the various sizes of stoves were capable of heating rooms of certain contents, notwithstanding that the ions for arriving at the quantity of heat dance with the nature of the wall, floor, and glass exposures indicated that such could only be approximated. A more e method of ascertaining the necessary stove was first to determine the total of B.T.U.'s required per hour, as l necessary by the requirements of the ar room under consideration. If 8,000 s were required per hour the stove have an external surface of about ft., *i.e.*, $\frac{8,000}{800}$ and assuming that the d a calorific value of 14,000 B.T.U.'s ur, it would consume about 1.43 lbs. per hour.

for the purpose of heating might be d in three ways: (1) By means of gas the more recent "gas grates") with "radiants," which required flues; gas-steam" radiators, which did not flues; and (3) by gas boilers (on the inciple as the ordinary low-pressure hot eating boilers) heated by means of a burner instead of coke or coal. Even hest claimed efficiency of gas-heated some 60 to 80 per cent.), when added gh cost of gas, put them entirely beyond l consideration for heating where there re than, say, two radiators, in which was preferable to install individual n radiators or gas fires. The employ- gas fires should be confined to odd s, offices, and similar rooms in which continuous heating was not required; that was to say, where it was desired to have heat for perhaps only half an hour or so per day, such as immediately before retiring at night, or for occasional use in an office for a short time. For purposes of this kind they were very useful, though at their highest rated efficiency (about 75 per cent.) they could not compare with central heating, even after allowing for their lower initial cost.

Gas-steam radiators were probably the best means of heating by gas. Owing to the absence of a flue the efficiency was, of course, 100 per cent., and the whole of the gas burned was utilised in warming the room. The construction of gas-steam radiators was similar to that of an ordinary hot-water radiator. About one-third of its capacity was first filled with water, which, on being heated by means of the gas-burners beneath, proceeded to boil and produced a similar effect to that of an ordinary low-pressure steam radiator. As a consequence the intensity of heat was not so great, and the disagreeable "baking" effect was not produced in the same degree, though to a certain amount there were obnoxious odours caused by the decomposition and burning of dust particles. Were it not for the gas fumes and the high temperature of the gas flame these radiators might compare favourably with the hot-water type, despite their higher running cost.

The next method of heating was that of electricity. Generally speaking, its advantages were similar to those of gas; that was to say, for intermittent heating or occasional use it was decidedly useful, but for continuous heating it bore no comparison with a centralised system. The objectionable liability to overheat the air of the room was equally inherent in this type of radiator, and it was not to be recommended where expense was a consideration.

The following table showed the relative hourly costs of heating by the various methods before described as compared with a system of central heating. For the purposes of this comparison a room had been assumed requiring, say, 18,000 B.T.U.'s per hour. This number of heat units represented the quantity required to take care of an average school class-room of, say, 20 ft. by 20 ft. by 15 ft. high, with normal exposure, heated to 60 degs. F. when 30 degs. outside.

	Hourly Cost.
Open Fire	2.52d.
Slow Combustion Stove	1.38d.
Gas Fire or "Grate"	3.30d.
Gas Boiler	3.09d.
Gas Steam Radiator	2.47d.
Electric Radiator	10.6d.
Oil Stove	2.52d.
Central Heating by Coke	0.71d.

It should, however, be remembered that the initial cost of any of the before-described intermittent systems was appreciably less than that of central heating. To extend the comparison, therefore, to-day's outside cost of a complete central heating installation might be taken at £20 per radiator. As that of a modern type of ventilating gas-fire grate—with fixing and pipe connections—would average about £6 each, the resultant saving in first cost was approximately 70 per cent. Calculating on this basis for a building requiring, say, twenty radiators, each having a heating capacity of 9,000 B.T.U.'s per hour, the relative initial costs were:

(1) Central heating, 20 at £20	£400
(2) Gas fires, 20 at £6	120
Additional initial cost of (1)	£280

The comparative fuel costs for equal heating periods were:

(1) Central heating: 7.1d. per hour. 12 hours, 7 days per week, 30 weeks per heating season	£374 11
(2) Gas fires: 33.0d. per hour. 12 hours, 7 days per week, 30 weeks per heating season	346 10

It was obvious, therefore, that for continuous employment neither gas nor electricity—and particularly the latter—could be said to compare favourably with central heating. There were other points which should be taken into account where buildings required intermittent heating only. For example: central heating did not lend itself so readily to occasional use, as the boiler could not be turned on or off as easily as a gas fire, though each individual radiator possessed this facility in an almost equal degree. And, again, for an installation of the size assumed in the example, the cost of attendance for stoking, &c., should be added to the running costs. This factor, however, varied so much with the size of installation that accurate calculation was hardly possible. Apart, however, from the two foregoing important considerations of initial and fuel costs, the advantages of central heating were still more pronounced when regarded from the standpoint of comfort, which was, after all, the principal consideration.

It was thus evident that the advantages undoubtedly rested with central heating as compared with intermittent heating, and it was to this system the closest study should be given. Central heating might be defined as a system by which two or more rooms could be heated from a centrally-situated agency, such as a furnace or boiler. The media employed were hot air, steam, and hot water, any of which might be distributed—either by natural or mechanical means—under varying pressure.

A large section of the general public believed that central heating was effected by means of steam, and few were able to distinguish it from a hot-water apparatus. Consequently, those who possessed a wide experience of Continental and American systems were perhaps a little inclined to express somewhat emphatic opinions. Steam was not the generally-adopted medium of central heating in this country. In fact, the extent of its employment here was relatively insignificant. The objections to the adoption of steam-heating media in this country were their inelasticity, whereby the radiators might be either on or off and the boiler worked at the same steam pressure, irrespective of variation in the outside weather conditions, and the consequent lowered degree of fuel efficiency caused by the overheating of the rooms in comparatively mild weather. To these might be added the difficulty of installation (a basement or sunken boiler chamber with pipe trenches was essential to its proper lay-out) and the possibility of disagreeable, noisy effects of "water hammer" arising from faulty design and erection. The numerous mechanical devices which had been applied to steam heating systems—such as automatic air valves, regulators, thermostatic valves, vacuum pumps, steam-traps, separate air-lines, syphons, mercury seals, exhausters, condensation pumps, and what not—all indicated that steam was generally favoured as a heating medium. This, to his mind, was to a certain extent due to the fact that the fundamental principles of low-pressure hot-water circulation by gravity were still but imperfectly understood, particularly in America.

The high-pressure hot-water system had become almost as extinct as that of hot air. It was unhealthy, inelastic, and extremely dangerous in the event of leakages in the pipe joints, and its application to-day was almost entirely confined to drying stoves and the like.

Generally, it could be asserted that on the score of health, facility of installation, and economy—both in initial and working costs—the low-pressure hot-water system was without question the most suitable for the English climate, and it was adopted in fully 90 per cent. of the buildings in which central heating was installed. Notwithstanding the long period during which this system had been employed, it was still so imperfectly understood that its application appeared to be very generally based upon empirical formulæ and rule-of-thumb methods of a strictly orthodox character. The proper design of a low-pressure hot-water heating system called for a greater degree of technical skill and application than that of any of the other systems named.

INSTITUTE OF BRITISH DECORATORS.

"HOW, WHEN, AND WHERE TO USE COLOUR AND ORNAMENT."

MR. WALTER J. PEARSE gave a lecture on the above subject at Painters' Hall, Little Trinity-lane, E.C., on November 15.

The lecturer said that his paper had been written for the painting and decorating trades, and was, therefore, of a somewhat technical nature. For the purpose of his lecture he divided his remarks on colour into four headings: æsthetic, corrective, informative, symbolical. If decoration were not wanted under these headings it was doubtful if it were wanted at all. Colour was demanded when there was a want of visual and intellectual satisfaction. The lecturer said that the æsthetic and corrective use of colour was to separate one object from another. Its informative use was obvious; and its symbolical value was expressed in heraldry. Its correct use, however, did not depend on taste. After all, what was taste? Its correct use depended on reason and law. It did not depend on chance: solid reasons were essential for its right employment. The lecturer wished that our eyes were as susceptible to colour as our ears to music. Although it was sometimes legitimate to have discords in colour, as in music the basic principles were, he reiterated, reason and law. In making the decision where to place colour, however, common sense was necessary. In the case of a door, for instance, it was not desirable to use a hard metallic green; neither was it desirable to use a bluish green. Woodwork should not be painted in a colour unsuited to its material. It was not customary to enamel Chippendale chairs, therefore it was not desirable to enamel doors. In a general scheme yellow was the most satisfactory colour. Even a painting was improved by varnish owing to the yellow tint in the ingredient. A bedroom should have a healthy colour; a nursery be without glare; a billiard-room restful. The lecturer mentioned the case of a painter who used black for a bathroom, and gave as his reason the excellent background it made for the human figure.

Hardness and flatness were the worst faults in the use of colour. Englishmen, the lecturer said, appeared to have a rooted objection to the use of bright colours. As an example he mentioned the Early Victorian and the "greenery yallery" days. Bright colour, however, did not mean crude effects.

The lecturer dealt with decoration and ornament under three headings: æsthetic, wealth, religious expression. Decoration was, he insisted, a combination of colour, line, and form. The right use of ornament depended on a sense of fitness, especially in regard to its use without colour. It was merely common sense that flat ornamentation demanded a flat surface. It was not desirable to place ornamental birds on floor spaces, neither was it desirable to place ornamental fishes on the ceiling; although the lecturer mentioned one case in which he painted fishes on a glass roof in order to represent the bottom of the sea in a ballroom. The bare lines of ornamentation should be filled in first (a sort of "noughts and crosses" arrangement), then the detail work finished. It was necessary to start from the bottom, and build up on a firm foundation. In dealing with wallpaper, it was essential that the flowers or leaves should be of natural size. Daisies should not be the size of dahlias. He mentioned a case where a rich wallpaper consisting of beech-leaves was entirely ruined through the leaves being too large.

The lecturer concluded with an interesting exposition of broken-colour effects; and pointed out that wallpaper possibly owed its charm to this effect. Actual examples shown by the lecturer were certainly extremely beautiful.

A hearty vote of thanks was accorded him at the close.

THE RENT ACT: SIGNING NOTICES OF INCREASE.

ACCORDING to a statement of the Property Owners' Protection Association made to *The Times* recently a point has been raised by the decision of a sheriff in Scotland, a court equivalent to a County Court here, that notices of increase of rent under the Act of this year must be signed by the landlord himself and bear his address, and not by an agent. Of course, under the "Notices of Increase Act, 1923," notices of increase have an added importance, as they also now amount to a notice to terminate the tenancy, but as far as we can see no change has been effected as regards the form of notice. Under the Act of 1920 section 3 subsection (2) it was provided that no increase should be due or recoverable until a certain period after the service of a valid notice "which notice shall be in the form contained in the First Schedule to this Act or in a form substantially to the same effect." Under the Notices of Increase Act "validated increases of rent" must be claimed according to the form in the Schedule to that Act or in a form substantially to the same effect, and the forms under both these Acts so far as the point we are considering is involved are in the same terms, they are headed "Form of Notice by Landlord" and conclude "Signed—Address—."

The third Act, the Rent and Mortgage Interest Restrictions Act, 1923, only touches this point in section 6, for it provides that "the county Court, if satisfied that any error or omission in a notice of intention to increase rent is due to a *bona fide* mistake on the part of the landlord, shall have power to amend such notice by correcting any errors and supplying any omissions therein which if not corrected or supplied would render the notice invalid . . ." and this applies to forms whether served before or after the passing of this Act. So far, therefore, it appears that there has been no change in the form since 1920, and if the signature of agents has been recognised there is nothing in the Acts themselves to alter that practice. On the contrary the latest Act has given a power to the Courts which they did not possess before to amend the forms. But this does not conclude the question, for these forms have been held to be statutory forms which must be strictly adhered to—see Peizer *v.* Federman and Penfold and Thompson *v.* Newman *Builder*, December 16, 1921)—and assu that the form must be signed by the lan it is doubtful whether the substitution o agent would be treated as "an error or omiss capable of amendment under section 6 o Act of this year.

No mention is made in the Acts of ag and all that can be said in the absence decision in the High Court (and we are not a that the point has ever been raised) is th the practice has been countenanced ever s rent restriction commenced the legisla has not rendered the forms more string but on the other hand in the provision we noticed in the last Act has shown an inte rather to relax the cast iron nature of the by allowing amendment by the Court in ce cases.

TRADE NEWS.

We have received from Messrs. Winser & Ltd., of 62, Buckingham Palace-road, S.W copy of their new No. 12 Catalogue of stonew sanitary appliances.

Messrs. Petters, Ltd., will have, at their u Stand (No. 10) at the forthcoming Smithf Show, a representative selection of their la oil engines and electric lighting sets.

Messrs. W. R. Crow & Son, timber mercha and importers, have now opened new head off at Norfolk House, Laurence Pountney H Cannon-street, E.C.4 (Telephone, Central 4 telegraphic address, "Bolection, Pho London"). The firm have also opened a wharf at Blackhouse-road, Deptford, S.E.8.

We learn that at the Barcelona Trade Exh tion the Gran Medalla de Oro (a gold medal) awarded to Mr. R. M. Nosworthy, of C Valencia, Barcelona, owing to the good qua of the P-V Brand Leather Cloth, for wh Mr. Nosworthy has the sole sale for Spain, behalf of the British Pluviusin Compa Limited, of Manchester, a Nobel Industries c cern.

Messrs. George Wright, Ltd., Rotherha have just issued a little booklet in which illustrated many fine examples of old Sus French, and Flemish fire backs. It is becom increasingly difficult to find genuine old fire ba in these days, therefore the reproductions Messrs. Wright will be very welcome. For practical purposes they are excellent and ha all the characteristics of the old ones. examples are from the Burton Weir collecti which is considered one of the finest in country.

FIG. 1.—HOUSES AT THE HAGUE, BUILT OF "KORRELBETON." (*See p.* 823.)

NEW INVENTION.

New Concrete and a New Method of Shuttering.

IN Holland, as elsewhere, various new methods f construction have been tried, and among hose which have been adopted to any consider- ble extent is a system of monolithic concrete onstruction invented by Mr. Greve, a Dutch rchitect, which possesses two special features. he first is the system of shuttering, whereby the alls may be poured complete or for one story at time at one operation, and the second is the mposition of the concrete of which the build- gs are formed.

The shuttering (shown erected in Fig. 2) con- sts of a wooden framework filled in with metal lates, and is placed in position in sections of height corresponding to that of each story of e building to be erected. This method has the dvantage that the shuttering of each story can e removed irrespective of the shuttering of the her stories, so that where several houses are be built it is not necessary to wait for the hole of the walling of the first house to become t before any of the shuttering is removed. hus, while the first house is being completed e foundations of the second house can be pre- ared, and the shuttering from the ground floor the first house to be erected, which has rdened in the meantime, is then taken down d used to form the ground floor of the second ouse. Whilst this is being placed in position, e first-floor shuttering of the first house is ing dismantled, and is ready to be erected for e second house by the time the ground-floor uttering is in place. The same process applies the second or any number of stories, and a nsiderable saving in time and form-work is fected. Another feature of the shuttering is at the plates can be removed from the frame- ork whilst it is in position.

The concrete, known as "Korrelbeton," is ade from furnace slag, broken brick, coke eeze, or other angular and porous aggregate pass a ½-in. mesh, bound together with Port-

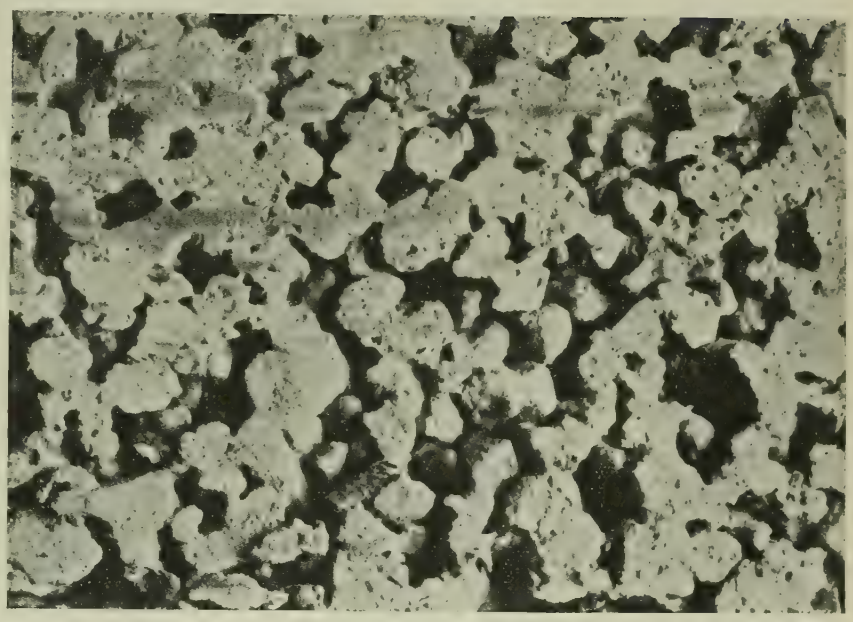

FIG. 3.—"KORRELBETON": ACTUAL SIZE.

land cement without the addition of fine material to fill the voids. For walls the proportion of cement and aggregate is 1 : 10, while for floors and roofs, in which case a finer aggregate is used, the proportion is 1 : 5 or 1 : 3. The resultant concrete is exceedingly light and porous (see Fig. 3), and it is therefore possible to use lighter shuttering than in the case of a concrete made with a heavier and more dense aggregate. The voids in "Korrelbeton" equal from 30 per cent. to 50 per cent. of the total volume of the concrete, and this, it is claimed, renders walls built of this material non-conducting of heat and cold, sound-proof, and fire-proof, while at the same time the light and porous concrete prevents condensation and permits of nails being driven into the walls.

The walls are rendered weather-proof with a 2 in. coating of cement, and plastered internally. No damp-courses are used, and in this connection we are informed that a piece of walling after standing in water for two weeks showed no signs of dampness above water-level. The outer walls are usually 12 in. thick for foundations and 8½ in. above ground level; divisional walls are usually 4 in. thick.

The method of erecting these houses is as follows. A raft foundation is first laid, consisting of a bottom course of 4 in. of "Korrelbeton" with the same size aggregate as is used for the walls, reinforced with a layer of mesh reinforcement laid 1 in. from the bottom, and a top course of 2 in. of "Korrelbeton" made with a finer aggregate containing only from 10 per cent. to 20 per cent. voids, thus forming a more dense and stronger concrete. The walls are then poured up to first-floor level, and the first floor laid on the same lines as the ground floor. The walls are then carried up to second-floor level and the second floor laid, and so on to any desired height.

It is claimed that the economies which are possible by this system, both in the cost of the concrete and the cost of erection, amount to about 20 per cent. as compared with brickwork. The shuttering is standardised in units which allow any architectural design to be followed, and we are informed that between 300 and 500 houses per year can be built with a plant costing £3,000.

Fig. 1 (page 822) shows a pair of houses built at The Hague on this system.

The Director of the Municipal Building and Housing Council at The Hague, and other Dutch and French building authorities, have reported favourably on this system, which we understand is shortly to be adopted on some further large schemes.

We are informed that a test carried out on 1 sq. yd. of "Korrelbeton" 6 in. thick, such as is used for floors, supported at each of the four corners, showed no deflection when loaded with 2,690 lb. in the centre of the slab.

An independent test carried out in London to ascertain the crushing strength of "Korrelbeton" gave the following result:—The sample was between ten and eleven months old, and measured 6.66 in. long, with a sectional area of 5.56 in. by 6.5 in., or 37.03 sq. in. The specimen failed at a load of 10.94 tons, that is, 42 tons per square foot, or 661 lb. per square inch.

Mr. C. R. Bartels, of 36, Duke-street, E.C.3, is the London agent for the system, which has been patented in Great Britain and Holland and other European countries.

FIG. 2.—SHOWING SYSTEM OF SHUTTERING.

CONTRACTORS FOR EXHIBITION BUILDINGS.

SOME correspondents have recently called attention to a difficulty which they say has arisen in connection with contractors who undertake the erection of temporary structures in buildings which are used for exhibitions or other like purposes. In such cases they say that usually an organiser takes a building and either he or his tenants place orders with contractors for the erection of the stands or other like structures, and this work usually occupies from three to six days, a period too short to enable the contractors to protect their employees from cold in winter or to provide lavatory accommodation, and that these conditions cause trouble with the men.

Our correspondents seem to assume that they are liable to provide warmth and other conveniences for their employees, and that the absence of these may give the men a cause of action against them, or that the authorities may even take action. We do not know on what basis this assumption is founded, as it certainly does not apply to men engaged on ordinary building operations where the provision of warmth would be physically impossible, and therefore we imagine that if any such obligation arises it can only do so out of the particular contract between the contractor and his men.

Our correspondents then suggest that, as it is impossible for them to supply warmth and conveniences on these short-term contracts, the person who places the work with the contractor must be liable for their provision and, further, that if the lack of them leads to a strike amongst the workmen compensation or damages should be recoverable from the person putting out the contract.

We cannot here advise on the law, but it appears that the answer to both these questions would be in the negative unless the matter is provided for in the contract between the principal and the contractor. We, however, give prominence to this question because, as it is to the interest of all parties engaged in this class of undertaking that the work should be carried out expeditiously and without friction, those organising such exhibitions may see their way to doing away with a possible grievance or hardship without prejudice to the undertaking; for instance, by installing the heating apparatus, if such is required for winter exhibitions, at the earliest stage in the operations and by seeing that other conveniences are available as soon as possible. So far as we can see any obligation can only arise out of contract both as between the contractor and his employees, and the principal and the contractor, and apart from contract we cannot think the obligations and liabilities suggested can arise.

It would even appear very doubtful whether an "organiser" would be a "principal" liable under the Workmen's Compensation Act to a workman of a contractor who from an unusual and exceptional exposure had contracted pneumonia, and thus had sustained injury by accident under that Act.

Bricklayers and House Building.

The suggestion made at a recent conference of Birmingham building trade representatives, held under the chairmanship of the Lord Mayor, that the workmen should agree to a longer working week, was submitted to a meeting of the operative bricklayers. The proposal was rejected by the trade union members, who definitely decided against any extension of the working week beyond 44 hours.

London Master Builders' Association.

The Council of the London Master Builders' Association has decided, as the polling for the General Election has been fixed for December 6, to postpone the Annual Dinner from that date to December 13.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	C'p'ters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½

HOUSING PROGRESS IN SCOTLAND.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to October 31, 1923 :—

Permanent houses completed.. ..	19,741
Temporary houses completed.. ..	665
Reconstructed houses completed ..	101
Houses completed under the Private Subsidy Scheme	2,287
	22,794

There are 3,063 houses at present under construction in connection with housing schemes carried out by local authorities and public utility societies.

The total amount paid by the Scottish Board of Health in respect of the 2,287 houses completed under the private subsidy schemes is £546,276 13s. 4d.

HOUSING IN SCOTLAND.

In the House of Commons last week, Capt. Elliot informed Mr. D. Millar that according to the latest returns received from local authorities, 20,507 houses had been completed under the provisions of the scheme under the Housing, Town Planning, &c. (Scotland) Act, 1919 ; 3,063 were under construction ; and 1,980 had not yet been commenced. In addition, 2,287 houses had been erected under the Private Builders Subsidy Scheme of the Housing (Additional Powers) Act, 1919. According to returns received for the period to October 31, 1923, under the Housing, &c., Act, 1923, 42 houses were in course of erection by private enterprise with the assistance of subsidies from local authorities ; 56 houses were being erected by local authorities themselves under the provisions of Section 1 (1) ; while 1,098 houses were under construction under the slum clearance schemes of local authorities. Except in the case of the slum clearance schemes (where 166 houses had been completed), no houses had been completed at October 31, 1923, under the subsidy provisions of the 1923 Act.

New Paint Depôt.

Messrs. Thos. Parsons & Sons, manufacturers of varnishes, enamels and colours, have recently opened a quick-service depôt at 476–480, Cathedral-street, Glasgow. The exterior of the premises has been painted in a colour scheme similar to that of the façade at 315–317, Oxford-street, London. The chief feature of this depôt is that several modern paint mills have been installed to deal particularly with urgent orders for special shades of colours in turps, oils or enamel.

Obituary.

The death took place last week of Mr. William Jones, of Geandale, Buckley, in his 80th year. Deceased was the founder of the firm of builders and contractors, William Jones & Son, Buckley.

POROUS HARD COU

THE L.C.C. have constructed a h for lawn tennis in Battersea Park, and of tennis were recently played upon following well-known players: M Austin, Miss Evelyn Colyer, Mr. A. D Mr. J. D. P. Wheatley. It happe heavy rain had fallen throughout the night and the public courts on the of the road were under water, but the constructed by Granuloid, Ltd., However, in order to prove the porous of the surface, water was freely pou it and when this quickly disappe commenced. At the conclusion of the players expressed themselves pleased with the court; its surface an qualities were excellent and the rebou ball was very true. The porous cha the surface is effected by the use of si which is granular, and below this spe position a gravel bed is prepared so water is drawn off quickly and the the court is not affected by frost, as proved in the case of another court co prior to last winter. Courts can be colour that is desired and this mixes in special material, so that it cannot wea the surface does not need recolour lines are inlaid in white and do no blurred. The courts cost nothing for ance. We understand that the cos costs are approximately eight to ten per square yard. The office of the co Red Lion House, Red Lion Court, Fl E.C.4, and the inventor of the proce H. G. Lloyd, M.Inst.C.E.

POSED NEW BUILDINGS.

(*Continued from p.* 829)

R. Co. has requested the Council to make up and path near th station, according to t estimate £2,500), and has called for plans consulting with the Company's Divisional

ON (DEVON).—The R.D.C. has decided to the Ministry of Health's subsidy per house and £150, according to the class of house —The T.C. unanimously resolved, in order rage building, to increase the Government o £120, and to purchase sites and offer the private individuals on the most favourable

AY.—The widening of the sea front promenade taken in hand almost immediately.—The of Transport has held an inquiry into a to construct a cliff railway at Babbacombe

AR.—The U.D.C. is to consider a scheme for uction of high level reservoirs.

RY.—The M. of T. have informed the local at a grant of £578 will be made by them the cost of building a new bridge between and Rangemore to replace the one swept a storm last July. The work is to begin at

HARTLEPOOL.—Plans passed by T.C.: Mr. bon, nine houses, Rossall-street; Committee homlinson Institute, Temperance Institute, treet and Houghton-street; Mr. E. M. 10 houses, Allendale-street, Seaton Carew; tephenson, 5 semi-detached houses, Ashley- The South Durham Steel and Iron Co., Ltd., g stores into a laboratory, Seaton Carew Iron H. Mason, Ltd., carriage house Park-road. RBY. — Amongst plans passed by the s one for the extension of dining-rooms and mprovement, for the Executive of the Race- o., Ltd.

FIRES.

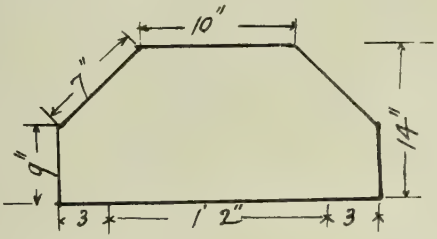
EPOOL.—The fitting and brass-finishing shops . Irvine's shipyard have been destroyed by

K.—Sunnyside, the residence of General h, at Kirkfield Bank, Lanark, containing X rooms, has been gutted by fire.

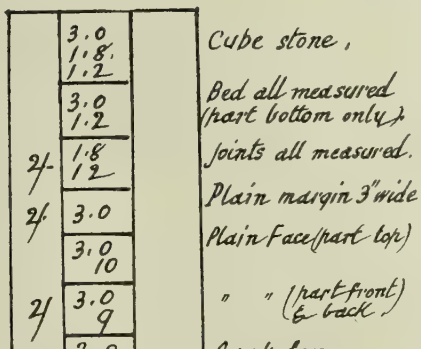
OOL.—Considerable damage has been done which occurred on the premises of Messrs. l & Co., Ltd., flock manufacturers and general s, 139–141, Vauxhall-road.

ALLERTON.—The large linoleum factory of ykes, Mills & Co., at Northallerton, Yorks, the scene of a fire which took seven hours , one wing of the works being gutted.

LL.—A fire at the leather works of Sir E. T. Sons, Walsall, caused £20,000 damage, a uildings being completely destroyed.



STANDARD METHOD OF MEASUREMENT.



"QUANTITIES" writes:—

SIR,—The "Standard Method of Measurement of Building Works," published by the Surveyors' Institution in 1922, states:—

Page 25, item 26: "Face labours shall be described and shall include all preparatory works and preparatory labours, except as follows," &c.

There appears to be confusion in Manchester as to exactly what this covers. I give a simple example, and would be much obliged if you could say where the above paragraph is correctly interpreted. If this should take too much of your space, could you tell me where I can get reliable information, as most text-books were

not based on the Standard Method published 1922

[**Our correspondent is quite correct in his reading of the "Standard Method of Measurement of Building Works" instructions as to the measurement of stone. In former times it was customary to measure "beds and joints" to all faces as a preliminary labour, but this system has been abandoned for a good many years.—ED.]

NEW BUILDINGS IN LONDON.

Carlton House-terrace.—ALTERATIONS.—We understand that No. 8, Carlton House-terrace is to be converted into several reception flats with rents ranging from £600 per annum to £2,000 per annum. These flats will be fitted with internal telephones, service lifts, modern sanitary fittings, passenger lift, &c., and accommodation will consist of dining rooms, drawing rooms, boudoirs, bedrooms, and separate kitchens and servants' offices, &c., to each flat. The architects are Messrs. F. W. Rees & Archer-Betham, of 44, Park-lane, Croydon.

City.—The Corporation of London has decided to widen Houndsditch to 50 feet from Bishopsgate to Phil's-buildings, and to 45 ft. from there to Cutler-street, subject to the L.C.C. agreeing to defray half the cost, estimated at £192,460.

Lambeth.—The B.C. has approved the proposal of the L.C.C. to extend the West Norwood tramway to the Crystal Palace.

St. Pancras.—The B.C. is considering building 72 flats at Somers Town, at a cost of £62,000.

TENDERS.

CXXV.—No. 4217. NOVEMBER 30, 1923.

HOUSES AND THE UNEMPLOYED.

THE acute problem of unemployment has again drawn attention to the possibility of absorbing unskilled labour on house-building. There is a serious shortage of houses. Consequently, it is argued, to make good the shortage would be an economic method of ng unemployed labour, even if it be not a remedy. The undoubtedly attractive, and we refer to it now as it is o be discussed in the near future in Parliament.

point is raised in Mr. Strachey's book, "Economics of ur," but unfortunately he assumes that the shortage es is due to two factors: because there is a positive e of labour, and because the workmen are not working as they should. The fact is 100,000 men in the building e unemployed, which means that there is not sufficient for building work at the present time. Admittedly ument cannot, in fairness, be applied to the building s. There can be no wide demand for houses while their c value is artificially restricted by the rent Acts, and ble is not that we are short of labour to build houses, t we are short of people who are willing to pay for them. le problem must be viewed in proper perspective, and we chary of attributing faults to an industry whose goods real economic value at the present time. If we are ing the question of bringing in unskilled labour to ore houses, we must inevitably face the question that must pay for the houses. If this means relying upon ernment we are back exactly where we have been for If there existed even a normal demand for houses (and ly means the ability and inclination to pay for them) le building industry would be fully employed and able b extra labour.

demand for houses from private owners is, generally , very slight; there is very little inducement to build speculative point of view, and but for the help from ernment the amount of house-building would be almost e, if we consider our annual requirements and the of the building industry. Examined in this light, the n for dealing with unemployment by organising es and battalions of men for work on housing does not o alluring. The idea certainly deserves serious atten- s is submitted, the two great and most pressing problems noment are met at one and the same time. If the trade is not fully employed there must be a reason. e sake of argument, we attribute this to the high cost ng we can only assume that the intention is to lower by absorbing unemployed labour from other trades. t is obvious there can be no increased demand for nless we compel ourselves to build them through the ent. On the other hand, no Government will sanction ding of public money in training unskilled labour and g a scale of wages above the standard of any other The problem is, clearly, a delicate one for the building f it is the question of cost which is restricting the it would, it has been suggested, be in the interests of ling trade to lower the rate of wages to bring the and absorb their own unemployed first. Otherwise nly suggest the Gilbertian cause that the unemployed ilding trade should be trained for some other industry busy. To reason on these lines is manifestly absurd, e dealing with an absurd anomaly when we pay unem- doles to one hundred thousand men in the building l at the same time can entertain the idea of absorbing ed from other trades.

demand for houses could be stimulated, the building ld, and would absorb the extra labour which would be In our opinion this course is infinitely more desir- the idea of swelling the ranks of building tradesmen first examining the causes which are preventing operations on a bigger scale. In some respects the is less complicated than many. Free Trade and form have nothing to do with it; we have no houses s from abroad, and apart from the rent restriction merely a question of demand and supply.

Undoubtedly we must make allowances for many prospective owners who feel that building costs are too high, but even so our sympathies lie with the building industry, which has to face the disagreeable fact that many people have ceased to regard house-building as an individual responsibility. To secure a roof over our heads is, and should be, one of the first considerations in any civilised country (the recent housing Acts are proof of this contention), but in these days it is hardly an exaggeration to say that many people are more interested in being able to scrape together sufficient means to purchase a small motor-car. Are we not, in our desire to move about, forgetting and neglecting the elementary fact that it is a physical necessity to live somewhere? We fully admit the difficulty in proving that one problem has anything to do with the other, and it is easy to dismiss the philosophy on these lines. We are definitely assured by economists that had there been no rent Acts there would have been fewer motor-cars, since more money would have been required either for increased rents or for building houses. We have no criticism to make of any social development; in a free country the individual must have liberty to decide what form his luxuries will take, bearing in mind the fact that we are told there is a shortage of one million houses. If the matter ended at this it would be immaterial whether we had houses or motor-cars, but unfortunately the same legislation which protects us in our houses makes it obligatory to take up the burden of building them.

To induce the man of moderate means to invest in a small car, the instalment system of payment has recently been introduced by many manufacturers. The significance lies in this: that if we cannot afford to build a house it is more essential from a national point of view to rent out of income than "motor out of income." There is certainly no blame attached to those who are protected by the rent Acts; on the contrary, it is stressing human nature to ask anyone to forgo his motor-car as part of the extra cost in building a house, which, so far as he is concerned, may also be regarded as a luxury. This philosophy of life is reacting right through our social structure, and the building trade must take these factors into account in its deliberations. Credit is due to motor-car manufacturers for their wisdom in bringing down prices to stimulate the demand. We see an economic truth justified, and the moral should not be lost sight of by the building trade.

It is for the building trade to face the various arguments which have been put forward; we have tried to help by discussing the situation as we see it. The country is obsessed with the idea—which is probably quite sound—that it is easier to train battalions of unskilled labour in a few weeks to do the work of house-building than it was to drill and train them into soldiers. Houses are pictured in this country similar to those in America, in the Dominions, and in the overseas world generally, where men build the houses in which they live. Some people have even toyed with the idea that we would again see quaint rural cottages racy of the soil; all the better if they lacked the exquisite precision and intricate details of the skilled tradesman. We would not minimise the fact that the necessity for houses is serious, but let us not confuse the necessity which compels a man to build himself a house with his own hands with the artificial necessity we have ourselves created which compels us to build our own and our neighbours' houses. It is evident that the sooner housing costs reach an economic rental level the better will it be for the building industry.

Meantime, we think it is more important for the building trade generally to study the reasons why there should be any unemployed at all than to shuffle the distribution of labour, oblivious of the economic truth that a man should do the work for which he has been trained. We would prefer to see the building trade dealing with the economic problem in its own way, and on its own initiative, rather than public opinion should force a situation which carries a sentimental appeal based upon fallacies and an imperfect knowledge of all the conditions.

NOTES.

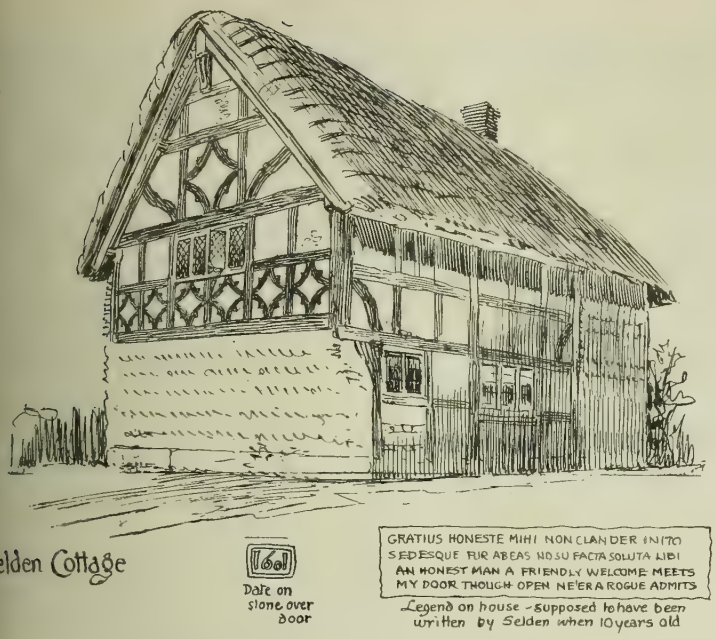
The Architecture Club.

The association of architecture with dining leads to congenial and flattering estimations, and we feel soothed by the reiteration of the importance of what we are concerned to find important. Yet this may be overdone. So Mr. Gosse, in his speech at the fifth quarterly dinner of the Club, pointed out that architecture was the only art of universal application, that a man might live without poetry or music, painting or sculpture, and so on, statements rather embarrassing to some of those present who may have felt a desire to be saved from such friends. This anxiety to say ple sant and gracious things may none the less lead us far away from the facts. Without poetry and the other arts we should most probably still be living in trees, and the application of tree dwellings to architecture is surely a little remote. How such ideas strike others may be inferred from a letter which we print in our correspondence columns.

The Sherborne Abbey Glass.

The discovery of a quantity of ancient glass in this Abbey is an event of considerable interest. The glass appears to have been removed, from an account of it appearing in the *Times*, from the upper parts of the choir windows, when they were filled with stained glass at the time of the nineteenth century restorations. It is fortunate that some of the old glass then removed should have been put on one side instead of being destroyed. While it will not be possible to reconstruct the series in its entirety, there are, in spite of being very much mixed up and broken, good heads and other pieces remaining, and we hope that these will be very carefully laid out, and if some reasonable additions of new glass will complete any panel in which bits are lost, steps will be taken to secure that this is done by a good artist, and that the purism, which might lead through a mistaken zeal to refrain from any such restoration, will not triumph. We are unable to judge, not having seen the glass, as to what is possible, but in the hands of a good craftsman the gaps, if not too many in a particular panel, can be made good, and is a legitimate and desirable form of restoration. And the gain over filling in the gaps with plain glass, when done properly, is incontestable, as the spotting of the painted glass with plain glass is very disfiguring to it. But it is through the more sympathetic appreciation of the artist rather than in the commercial approach that such restoration is alone possible. This Sherborne glass is said to be unquestionably English and fifteenth-century work. Mr. Bernard Rackham, the head of the Department of Ceramics at the Victoria and Albert Museum, in whose care the glass has been during the last few months, says that he has never come across anything like it in all his experience of English glass. The present find includes some shields which are apparently contemporaneous with the rest, including those of the family of Beaufort, one of, presumably, the consort of Henry of Lancaster, and others. They have, however, unfortunately suffered under reconstruction, probably in the eighteenth century.

The Imperial Institute.



The original purpose for which this institution was founded is not one which is now within the bounds of practical possibility of fulfilment. The great developments during the last generation or so have all tended to make the aims of such a central organisation, as the Imperial Institute was originally intended to be, impossible. In thinking of possible new scope for such an Institute, and one which might be stimulating to national interests, it occurs to us that as a home for the exhibition and extension of their publicity, and as a department devoted to English handcraft industries and for societies identified in the production of such work, the fostering of whic so desirable, a profitable use coul made of such a centre. The further of the interests of such work is p cularly important just now on nati grounds, and should effect impor reactions on the standard of Bi industries. There are also other colla directions which such a centre sh include, embracing fine as well as ap art. We are beginning to take a reasonable view of the relation bet the latter and ordinary manufact and that in providing such a centr are only extending trade facilities in their larger attributions.

Artistic Industries.

The line which has drawn in the past bet manufactures and directly artistic industries is seen t artificial. We have assisted the fo by much organisation and subsidy. British Industries Fair, the Depart of Overseas Trade, being examples of We are beginning to see that a support is equally desirable for indu connected with a more personal c manship, and that the small work and the individual craft worker sh not in the interests of the national w be left neglected. We are no doubt at the beginning of these more enligh conceptions, but with the stimulus ing through a more extended traini craftsmanship, there is need for ste be taken to consolidate the new dev ments arising through it. To foster new directions is in the way of cre new wealth which we are much nee At the present time, for the lack more corporate representation as existence of such a centre as suggest could bestow, this new and craftsmanship is lacking in publicity therefore opportunity. The Im Institute, in becoming a centre fo advancement of these interests, effect a powerful influence on the dards of more ordinary manufactu well as assisting employment, and n

be well spent in such a way, while mperial Institute, in becoming their should achieve a new lease of life.

The aics at Tate llery.

THE mosaics recently completed by Mr. Boris Aurep in the Blake Room at the Tate Gallery are interesting nly for themselves, but in their aim romote an identity between the ndings of Blake's work and the itself. Along such lines there is for a good deal of development in g our public galleries more accordant he work shown in them, and it is f value as pointing to the necessity e employment of artists to carry out ork and to secure the distinction of ent that is necessary in order to such accompaniment suitable lesirable this is we may see when in ational Gallery, which lacks in the tion of the rooms the stamp of a more authentic artistic treatment. We are glad to see the further recognition of this in the employment of Mr. Aurep to carry out the mosaics on the floor of the Blake Room. A useful little instance and of more tentative character, providing a good illustration of the value of artists' work may be seen at the Suffolk-street Galleries, the walls of which have been painted recently by members of the R.S.B.A. themselves, the result being quite successful. A pleasant texture and colour has been given to the walls, possessing much more character than the smooth featureless tinting of the ordinary house decorator. The times call for this more direct appeal for the artist-craftsman in these ordinary services of life, and were he employed more often in such ways the many craftsmen now lacking employment could add much beauty and individual distinction to our homes and public buildings. The directors of the Tate Gallery are to be congratulated on an enterprise which is not only successful in itself, and of much credit to the artist, but also enlarges the scope of the application of art, and gives encouragement to the artist.

A Kensington Housing Issue.

THE issue of 1,247 ordinary shares and 300 three per cent. debentures, made by the Improved Tenements Association under the auspices of the Kensington Representative Housing Association, deserves a generous response, and, we may hope, will be followed in other boroughs. We have enough discussions of rival prejudices, disguised as principles, of past history and mutual recriminations. Slums and overcrowding persist, a peril to the poor and a menace to the health of society. The difficulty is not one for any political party to solve alone, nor for any political party to boast about. Nothing but intense and sustained public effort can end the social sickness, and the sooner this is applied and the more practical the application the better. Such associations owe their origin to that attractive power of practical idealism for ever identified with Octavia Hill. The work attempted does not claim to be a solution, but a palliative; but, with the solution so far away, we may be thankful for the palliative, and for every family that is lifted from disease and demoralisation. Cancer and tuberculosis are not allowed to go untreated because the cure is being sought, and the cure itself is often to be found through the experience gained in the palliative treatment. As a comment, the title of Improved Tenements is misleading. The Association, surely, is not pressing for more tenements, even if improved, but has derived its title from its efforts to improve and convert existing tenements? The objections to this form of accommodation are too many and obvious to need repetition.

Entrance to Cemetery, Vienna, by Hegele: 1905. (*See p.* 842.)

GENERAL NEWS.

Appointment.

Mr. W. H. Bateman, of Calne, Wiltshire, has been appointed Architect and Surveyor by the Hay (Brecon) Council for the new cattle mart to be erected at Talgarth, to accommodate 3,500 sheep, 200 cattle, besides pigs and other animals.

Obituary.

Mr. C. E. Clayton, who died at the age of 70 years, at Edburton, on November 27, was senior partner in the firm of Clayton & Black, architects, of Brighton, with which town he had been associated for over half a century He designed the buildings for the casino scheme formulated by the late Sir Joseph Lyons in connection with Sir William Forbes and the late Lord Bessborough. He was also consulted by the Town Council in the preparation of the plans for a grand opera house on the site of the Aquarium, and he was engaged in a similar capacity by the promoters of last year's scheme for the conversion of the property into a motor coach garage with roof garden. The concert hall on the West Pier is another of his works.

R.I.B.A. Statutory Examination.

The attention of architectural students is called to the statutory examination of the Royal Institute of British Architects. The Building Acts require every candidate for a district surveyorship to hold a certificate of competency of the Royal Institute of British Architects. In addition to certificates of competency for the office of district surveyor under the Metropolitan Building Acts, certificates are also granted of competency for building surveyor under the Public Health Acts. Many architects in the past sat for it who have never applied for a district surveyorship, but have taken the examination as a qualification for private practice.

Antique Furniture.

Mr. Mordaunt Rogers, F.S.I., F.A.I., gave the first of two lectures on "Antique Furniture" at the College of Estate Management last week. The lecturer took as the starting point of his lecture the eleventh century, the period which saw the building of the Gothic cathedrals in France. He then dealt with the changes through the various centuries, showing how the ornamentation of panels on chests was introduced in the early fifteenth century, followed by the enrichment of chests in the sixteenth century. He also showed how later in this century the practice of varnishing furniture was introduced. The lecturer also dealt with the various woods and their uses in furniture, and mentioned that the walnut tree was not introduced to England until the end of the sixteenth century. The lecture was illustrated with lantern slides provided by the authorities of the Victoria and Albert Museum.

The Surveyors' Institution Examinations.

The paper on the Elements of Copyholds will be omitted from the Intermediate Examination after March next; Elements of Building Construction being substituted in its place. The Enfranchisement of Copyholds will, however, be continued as a subject for the Final Examination, the syllabus being extended to cover the calculation of compensation payable under the Law of Property Act. (Insanitary areas: basis of compensation.)—The Council have had under consideration the effect in operation of Section 9 of the Housing (Town Planning) Act, 1919, and in particular the proviso thereto, which has been shown in recent cases to impose extreme hardship in certain instances. A communication on the subject has been addressed to the Minister of Health, giving particulars of cases where this result is to be feared, and suggesting that until amending legislation can be introduced special care should be taken to ensure that only houses which are in themselves insanitary and unfit for habitation should be scheduled as "red."

COMPETITION NEWS

Holmside.

FOR THE HOLMSIDE AND SOUTH MOOR COLLIERIES.—Designs for a cottage hospital. Sending-in day, December 7. (See advertisement this week.)

New Law Courts, Cairo.

The Competitions Committee of the R.I.B.A. are in negotiation with the promoters of this Competition in the hope of securing an amendment of the conditions.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Singapore College (Jan. 1, 1924; March 30). Dudley Memorial (Jan. 5, 1924; Sept. 14). Eas and Bishopstoke Assembly Hall—*Ban R.I.B.A.* (Dec. 3; **August 24**). Memorials Missing (Jan. 1, 1924; Aug. 3). New Concert Hall (Feb. 1, 1924; Oct. 26). Empire Exhibition Decoration (Dec. Oct. 26). Essays on Concrete (Dec. Nov. 16). Belfast Union Heating and Li (Dec. 18; Nov. 9). Essays on Heatin Ventilating (Mar. 31, 1924; Nov. 9). Police and Fire Station (Dec. 18; Nov.

NORFOLK AND NORWI ASSOCIATION OF ARCHITECTS.

A LECTURE on "American Architectur Saw It" was given by Mr. E. W. B. A.R.I.B.A., at the Technical Institute, No on November 23. The chair was taken b A. G. Howlett.

The lecturer said he visited the Stat Canada in the spring of this year for the p of studying American architecture, beca believed the best work in the world was done in America. During his visit h nothing to modify and much to confirm belief. This was not to say merely t America their wealth enabled them to expensive buildings, for their best work. often rich, did not flaunt its costliness did not suggest that all American buildin good—far from it. There had been dur years or more an amazing amount of bu and a large proportion in America, as w case elsewhere, was not the work of arc at all. There was, of course, much th bad; but he did say the average in Ameri higher than the average of modern worl where, and the best in America was abs and unquestionably the best that was done anywhere. There were, of course, n less historical buildings in Europe of wh did not speak, and American architect their greatest admirers. This was for tecture a time of experiment and advance—of false starts and disappoint The architecture of America was leadi pioneer work, and he asked them to st with eyes not on the dead past, however but on the future. Only so could they ciate the interest and significance buildings he was going to show them.

INGSTON-UPON-HULL ART GALLERY COMPETITION.

[By an Architectural Critic.]

Right Honourable T. R. Ferens having
l a site in Victoria-square, in the
f Hull, and the sum of £52,000, for
pose of erecting an Art Gallery, the
tion retained the services of Mr.
. Simpson, PP.R.I.B.A., as assessor.
instructions to competitors, whilst
limiting the cost, left the arrange-
the galleries entirely to the discretion
competitors. Briefly the accommoda-
uired consisted of various offices, "a
gallery of about 1,500 ft. super, or
junction with the paintings," for
g works of sculpture, and hanging
for the present City collection
t 550 lineal feet of wall hang-
ace, and 490 feet for the loan
n. The only means of access
ite was from the Victoria-square. It

rst premiated design, No. 15, is by
S. N. Cooke, F.R.I.B.A., and E. C.
A.R.I.B.A. (illustrated in *The*
November 23). They have adopted
ceiling lights, double glazed, their
section being apparently identical
t of the existing Corporation of Hull
ery (which, though better than many
is not perfect—it is modelled on
Ghent). Their artificial lighting is con-
the roof between the roof light and
ng light. The plan is simple. The ac-

commodation is provided on two floors. There are seven galleries on the ground plan, all of adequate width and good proportion, grouped round the central sculpture hall. On the first floor is one gallery for the loan collection. In addition, pictures are hung round the upper part of the sculpture hall. We consider this a defect in the plan. As submitted, the plans show two galleries of the loan collection on the right hand side of the entrance, separated from the lift by the entrance hall. This would cause confusion when the loan collection was being rearranged. It could be obviated by reversing the use of the galleries and exchanging the position of the curator and sanitary conveniences. The ladies' and gentlemen's lavatories are too close together. The principal elevation to Victoria-square is in Ancaster stone in the Renaissance manner, well illustrated by the ½-in. detail, but hardly suggestive of the use to which the building is to be put. The elevations to the south and east are of brick, plain and incongruous. The building will be seen from three sides. It will be possible to see the front and part of the east elevation at the same time; it is a pity that they have no relation. But the authors, having spent their money where it will be always seen, have been obliged to neglect these two fronts east and south in order to comply with the clause as to cost. In thus deciding they are unlike the great majority of the competitors, who have treated the three elevations, though not of equal value, at any rate as a whole. Much as we dislike the pictures in the upper part of the sculpture hall and the neglect of the side elevations, we think the authors provide a slight margin of satisfactorily lit hanging space over the other top-lit competitors.

The second premium goes to Messrs. J. S. Gibson and Gordon. Their plan is better than the winners'. All the accommodation is on one floor, except the curator and ladies' lavatory. All the elevations are treated with respect. The lift is properly placed to serve the loan collection. But where they fail is in their method of lighting. They have only provided simple skylights without any outer glazing; these would cause trouble in practice. The elevations suggest the use of the building, but are in no way remarkable. Their artificial lighting is stated in the report to be concealed on the cornices of the gallery.

Among the top-lit designs deserving of comment are the following (where no address is given the authors are of London):—

No. 21, by Mr. E. Vincent Harris, places all the galleries on one floor. His sculpture hall runs from north to south of the site. His elevations are simple and scholarly. The building looks what it is. His roofs are double glazed. The porter's box is omitted. Could be built for the money.

No. 42. Messrs. H. V. Ashley & Winton Newman submit an imposing scheme for a fine building viewed from all sides. It does not appear to be adequately lit on the ground floor.

No. 59, Messrs. Lanchester, Lucas and Lodge. A bold building on two floors. Represented by a fine set of drawings.

No. 61, by Messrs. Forbes & Tate, FF.R.I.B.A. This is a design which is probably as good as either of the premiated, in some respects better. The lift is badly placed. The porter is not as well placed to supervise the entrance as in the winning design. Possibly this set was regarded by the assessor as likely to exceed the cost. It is cubed by the authors at 2s. 1½d. a foot.

Chapel of the Asylum, Vienna (1909).

By Otto Wagner. (*See p.* 842.)

The competitors who favoured the top-side-lighted methods, though defeated, are not disgraced.

No. 7, Messrs. Louis de Soissons & George G. Wornum, F.R.I.B.A., are represented by a beautiful set of drawings. Their sculpture hall traverses the site from east to west on the north front. The scheme No. 19, by Messrs. Horth & Andrew, of Hull, is entirely top-side-lit, including the sculpture hall. They have provided two floors with more accommodation than is asked for. The section through the galleries is ingenious. The curator has a big room in the basement. No. 24, by Mr. A. G. R. Mackenzie, F.R.I.B.A., is represented by a good design. His sculpture hall is not very well lit. No. 28, by Messrs. Taylor & Young, of Manchester, in our opinion, is the best of the top-side-lighted designs. The accommodation is all on one floor. The galleries are, perhaps, a shade narrow. The entrance to the galleries is from the sculpture hall; we do not think this a serious point. The porter is well placed. There are two lifts as in the winning design. The elevations are good and suggest the intention of the building. No. 35, by Mr. Dudley Harbron (Harbron & Robson), Hull, provides all the accommodation on one floor. His sculpture hall is insufficiently lit. No. 68, Mr. Cecil Alexander Sharp, F.R.I.B.A., like No. 19, is entirely top-side-lighted, including the sculpture, though in the sculpture hall the wrong wall appears to be illuminated. The sculpture hall is across the front of the site. It is too narrow, and not big enough. His loan collection is arranged *en suite* on one side of the entrance; his permanent collection on the other. He has an interior court-yard lighting the basement, and his elevations are the most unusual of all those submitted.

The Master Carvers' Association of London.

The annual general meeting of the Master Carvers' Association was held on November 23, at the studios of Mr. W. Aumonier. The President, Mr. W. D. Gough, having occupied his position for three years, vacated the chair, and Mr. Lawrence A. Turner was elected in his place. The following are the results of the other elections:—Vice-President, Mr. W. D. Gough; Hon. secretary, Mr. W. Aumonier; assistant hon. secretary, Mr. W. Whitworth Aumonier; hon. treasurer, Mr. J. D. Daymond; committee, Messrs. Bentham, Bradford, Broadbent, Frith, Hook, Morton, Southwick. The Master Carvers' Association is representative of employers of carvers in London, and any employer of stone carvers who is not already a member of this association is invited to apply to the hon. secretary, Mr. W. Aumonier, 84, Charlotte-street, Fitzroy-square, London, W.1.

CORRESPONDENCE.

Hull Art Gallery Competition.

SIR,—The result of this competition must be somewhat of a shock to those competitors who endeavoured to model their galleries on the now accepted and correct principle of lighting, for the reason that it has been conclusively proved by those who have devoted much study to the subject that the usual central ceiling lighted gallery is a failure.

In such gallery the spectator is better lighted than the picture, resulting in glitter and reflections; the spectator is compelled to adjust his eyes to two focal planes and suffers in consequence; moreover, the picture can neither be properly seen nor studied. That the picture and not the spectator should receive the greater light is well understood, if the glaring defects peculiar to the central top-lighted gallery are to be avoided, and that, therefore, the proper and correct lighting is the top side light, which is now an established fact.

Clause 10 of the Instructions contains the following:—"The Galleries may be disposed on two floors, and special consideration must be given to both daylight and artificial lighting. The primary consideration is the exhibition of works of art rather than the architectural proportion or embellishment of the galleries." It was fair, therefore, to assume that whatever the plan, this fundamental principle of lighting would be adhered to.

The assessor has selected a design which apparently is based on the central top-lighted gallery type, with its attendant defects. It seems quite hopeless, and one is tempted to ask, in view of this award, Why lectures by experts? Why the publication of papers and data in the Institute *Journal*? Why any definite decision? if the scientific and correct principles established are to be set aside.

The architectural treatment may be a matter of opinion and taste, but the fundamental principle of correct lighting is neither a matter of opinion nor a matter of taste; it is one of fact.

That the assessor has selected, *in his opinion*, under the circumstances, the most suitable design may be perfectly true; but the fact remains that in view of the considered opinion in favour of top side lighting, of those qualified by study to speak with authority, a design has been chosen which follows the old-fashioned central top lighting with its attendant defects.

Unless, therefore, one is to believe "A Different Assessor," "A Different Result," the existing competitive system sadly needs revision, and I suggest the constitution of a tribunal of experts, in the case of a single assessor, which should consider the award before the final decision were determined.

Croydon. W. BEVAN.

SIR,—Your recent letters and articles on the subject of competitions have awakened considerable interest, especially amongst the younger members of the profession. There is an increasing feeling that the present system of assessing is obsolete; a jury is essential.

May I point out a few facts concerning the recent Hull Art Gallery Competition. Quoting from the "Instructions,"—"Special consideration must be given to both daylight and artificial lighting. The primary consideration is the exhibition of works of art. . . ." Of recent years much time and study have been devoted to the perfection of a scientific system of lighting picture galleries. Mr. S. Hurst Seager has demonstrated the case very clearly. (*Vide* R.I.B.A. *Journal*, November 1912 and January 1923.) He has proved that satisfactory lighting can be obtained only by fulfilling two conditions: (*a*) the pictures must be so arranged that the source of light cannot be reflected to the spectator's eye; (*b*) a full and direct light must fall on the picture whilst the spectator must be kept in a more subdued light, to minimise the reflection of his own image. The latter condition has been utterly disregarded in the winning design, which repeats the monotonous fallacy of a glaring top light falling on the spectator. It is safe to predict that the results in practice will be highly unsatisfactory. That more scientific solutions were submitted is shown by the exhibition at Hull. If functional fitness be the essence of architectural design, how can the present award be justified? I realise, of course, that other conditions may have been such that the assessor considered them of primary importance, but, as a matter of principle, I do not wish to let this assessment pass without a protest against the repetition of demonstrated fallacy and the loss of one more opportunity for progress. Disregard of such matters cannot but tend to lessen the confidence of the public, to the detriment of the whole architectural profession. Relying upon the cumulative force of insistent repetition, I once again point out the urgent necessity of adopting the jury system of assessment.

I trust that all who read this letter may recognise in it a broad plea for the reformation of our methods, and the entire absence of any personal imputation whatsoever.

T. H. FIELDER.

The Cambridge Collegiate Buildings Competition.

SIR,—As one of the architects who was honoured with an invitation to take part in the competition for the new buildings for King's College, Cambridge, I feel very strongly that the letter published in your issue for November 16 and signed by Messrs. Tait, Holt and Rees, cannot be allowed to pass without comment. The authors of that document in making public their several private misfortunes appear to place themselves professionally in a very queer position.

They assert that the winners of the competition ignored the conditions, and instance as an example the fact that twenty instead of twenty-two sets of chambers were provided in the successful design. This arrangement any competitor was perfectly at liberty to adopt in his scheme if he thought fit, just as he was equally free, according to the conditions, to put his top story either in the roof or not, as he might think best. In the early stages of developing my own design, I, at least, tried these alternatives and for various reasons abandoned them. Perhaps it would have been better for me if I had not done so; but I am not now going to pretend that they were specifically ruled out by the conditions, and Messrs. Tait, Holt and Rees should not either. These gentlemen are at pains to imply that the assessor was unfit to act and that a result more satisfactory to them would have been obtained if a jury rather than an individual had been entrusted with the responsibility of judging.

I would point out that neither Mr. Tait, Mr. Holt nor Mr. Rees were under any compulsion to accept the invitation to enter the competition; that, if they had such definite opinions about the incapacity of the assessor and about the defects of the system of individual judgment, they should have declined to enter; and that if, in spite of these considerations they still desired to compete, they should have regarded themselves as bound to accept the result decently. Professions of general public zeal and of particular concern for the welfare of the profession cut more ice when the issues are raised by persons less obviously interested than are Messrs. Tait, Holt and Rees in the present case.

I am sure that I speak for the rest of the younger men who were invited by King's College to participate in this competition when I say that we valued the invitation because it gave us just that kind of opportunity and recognition which we need and which so rarely comes our way. I at any rate want to dissociate myself from any criticism of the conduct of the competition. W. NASEBY ADAMS.

Strand-on-the-Green Wall.

SIR,—I was amazed to read in your issue of November 23 that the Art Standing Committee of the R.I.B.A. had thanked the Chiswick Council for conforming to their wishes in regard to the new river wall at Strand-on-the-Green. I take the following paragraph from the *Journal of the R.I.B.A.*, of July 14 last:—

"Members of the R.I.B.A. Art Standing Committee accordingly attended a n the site, and then discovered that th the foundations of the new section at present being dealt with was a position, and a fairly long stretch o walling almost completed, faced wi walling of a most mechanically uni kind entirely out of harmony wit roundings. The Institute's repre pressed that the exposed portion o still to be completed should be face bricks of the character shown in porti existing adjacent river walling and i charming houses lining that part of and should be finished with a thin, p coping, also of the character of the w vicinity. It was understood from the to the Council that they had a quant bricks in store that could be used, discussion the Chairman of the Co other members attending *agreed that t in treatment of the wall should be arra*

The wall as executed is of the same ally uninteresting rubble. The stone clumsy with only a slight projectio river side, and none on the walk s wall is by no means almost entirel but is, on the contrary, very conspicu

The *Chiswick Times*, of November observes that the alteration in the c the only point in which the Council h its original design, which is now s approved."

Those of us in Chiswick who ar against heavy odds to preserve what our old-world riverside will never en Art Committee's approval of a work consider poor and unworthy of the op

Chiswick. E. DACE

The Architecture Club.

SIR,—Architecture is so noble and re tive an art that the sentimental at which are sometimes given to it, as t were present at the last dinner of t tecture Club may have realised, are akin to "painting the lily," and wi cheap colours. These daubers and of architecture are really not its bes flatterers rather of that vain inver "mistress" art. The arts are seen be out of and through each other, and a whole. There is no first or last in ar tecture is greatest when not too co itself, and the inflated attributions dinner orators designed to raise it to plane than poetry, music, painting or are not only apt to raise a smile, their ignorance of wherein its true grea Architecture is not well served in suc ing, and I recall something about "goo Architecture has been described as "t manly profession"—horrible phrase—diction, no doubt, of the more provi couth and parlour qualifications of poetry, painting and sculpture. H better than all this to let the art itself, and so withstand the challeng who find only a quarter of the artist in of the architect.

Does it not increase the feeling of t to art of the very means through seek to promote it, forgetting that add one cubit to its stature by all our tion and oratory, though it may appe to our own. We have grown so muc habit of belief that large membership, dinners, and much official activity water the garden of beauty, that we t for granted—but does it do so? May be some misunderstanding of the nat in such reliance on it? The most of individuals may even feel a doubt an account recently given of the great in manifold ways of the R.I.B.A. Un of it I had not realised that this di already overtaken architecture, and I whether all this gregarious sort of fostering, with its registration enterpr not yet prove the grave of such encou of architecture.

Mr. E. Stanley Hall, F.R.I.B.A. (President), cupied the chair at a general meeting of the chitectural Association held at No. 35, dford-square, W.C., on Monday last.

Accounts.

After the Minutes of the previous meeting had en read and approved, the Honorary Treasurer r. L. S. Sullivan) presented the accounts for the sion 1922–1923, which showed a deficit of 84 for the year. During the year a sinking nd of £12,000 had been formed, which would ture a year or so before the lease of the pre- ses expired. During the year £600 of deben- res had been paid off. He also announced at the Massachusetts University had offered annual sum of 100 dollars for the use of the sociation, and that it had been allocated for e purposes of the library.

New Members.

The following were unanimously elected new mbers of the Association :—

r. E. C. P. Allen	Mr. H. H. Goldsmith
ss C. W. Preston	Mr. L. H. B. Roberts
r. S. H. F. Lloyd.	Mr. J. H. Bolton
r. G. C. P. Gough	Mr. J. Breakwell
r. R. T. Beck	Mr. H. Cholmondeley
r. A. B. Whittingham	Mr. H. J. R. Pease
r. F. J. Lander	Miss M. E. W. Colam
r. L. M. White	Mr. G. Pringle
r. H. A. Welch	Mr. E. S. Smith
ss E. A. Swift	Mr. L. J. Collmann
r. K. Anns	Mr. A. W. Hastings
r. B. Coghlan	Mr. S. D. W. Timmins
r. G. A. F. Parry	Mr. R. S. De R. Harman
r. G. D. Smart	Mr. D. C. Saunders
ss J. Fletcher	Mr. E. B. O'Rorke
r. E. G. Gardner	Mr. A. V. Booker
r. H. T. Rix	Mr. D. H. Davies
r. N. Bomer	Mr. K. S. Tayler
r. A. W. Warland	Miss A. J. Cooke
ss B. Scott	Mr. A. W. G. Lowther
ss D. E. Spencer	Mr. E. I. B. Jeffcott
r. B. Dower	Mr. G. D. Shields
r. K. J. R. Peacock	Mr. E. G. Gillick
r. L. F. R. Coote	Mr. A. T. Bradford
r. C. W. Sully	Mr. J. R. Moore
r. J. H. Watkins	
ss F. V. J. Barker	

Six nominations for election were announced.

THE STUDY OF OLD BUILDINGS.

Mr. J. A. Gotch (President of the Royal titute of British Architects) then gave an ress on "The Value of the Study of Old ldings," illustrated with a number of lantern es depicting the different periods of architec- e, woodwork, stone-carving, &c. He said le a great advance in the methods of archi- ural education had been made during recent rs in some respects, he hoped there had not n a backsliding in others. He had heard it ed that the study of old buildings was not sed on with such favour nowadays as in the t, and that the study of Gothic work was g neglected. But he was fully persuaded of value of studying old buildings, and par- ularly Gothic work. Since he took up sketching old work the practice had been a pleasure to him every day. It had the advantage of getting one into all parts of the country; or if business or pleasure took one on trips to fresh parts of the country some very pleasant hours could be put in with a sketch book. Measuring and sketching buildings helped the student to learn for himself, and in his opinion that was better than being taught by even the most able teachers; he was sure that what one found out for oneself was retained in the mind more permanently than what one learnt from books. He believed nothing was more useful in designing buildings or adjuncts to buildings than to see a model of them, and in the ancient buildings were to hand the most admirable models. The object of architectural sketching was not primarily to make a picture for exhibition, but to convey information of how things were done and how they could be done again. He had nothing to say against pretty pictures, which exercised a very special kind of talent, but in his view the real object of architectural sketching was to get at the heart of the building or object sketched and see how it had been executed in the past and to judge the effect of the work that had been done in the past by someone else. He thought it quite impossible for even the most enthusiastic person to evolve in a moment a new style of architecture. The whole of architecture hitherto had been a process of evolution, and that was one reason why he could see no beauty in and no future for the cubist school.

In conclusion, he said heraldry was a subject of the greatest interest to architects. The subject was not so difficult as might be supposed, and with the aid of a simple book on heraldry it could be mastered fairly easily. Nothing was so good for studying the subject as a series of tombs, and nearly all over the country tombs could be found with the same sort of angels holding the same sort of shield in the same sort of niche. He knew of no art which so well led one to study the vigour of line. Some of the heraldry was extraordinarily interesting; the same sort of animal which occupied a long and narrow space on one occasion would be found in a square space in another example, but the skill of the artist and the vigour of the drawing had managed to fill both spaces properly with the same device. Those who wanted to spend their holidays with a sketch book could find an enormous variety of work of a simple kind all over the country.

The Chairman proposed a vote of thanks to the lecturer, and said they were very pleased indeed that the President of the Royal Institute had been able to find time to address the Association. It was thirty-six years ago since Mr. Gotch was President of the A.A., and he was the fourth President of the A.A. who had passed on to be President of the Royal Institute. He thought architects who built so much in the Renaissance also loved the old architecture when they got away to see the charming examples of past architecture with which this country abounded. For better or for worse, it had been judged that such work was not applicable to the present time, but it was for present-day architects to see that modern architecture was as suitable for the present as was the glorious architecture of the past in its own time. The architect who thought he could design a building like nothing that had gone before must be a most arrogant egotist. After all, the Parthenon was designed in a style which had been running for many centuries; the Taj Mahal was a typical example of that type of Mogul architecture. Old buildings could be studied in two ways: they could be studied archæologically, but architects should also endeavour to make them live—to find out what relation the old buildings had to the problems of the present day. The fundamental problems of building were the same from the beginning of time; the provision of a weather-proof wall and roof on sure foundations, with holes to let in the light and to permit people to get in and out. Those fundamental requirements had to be studied in connection with the conditions which affected them at the time—conditions of climate, and sunshine, and materials; of traction, political conditions, &c., a stable or an instable government, and, perhaps more important than all, the ideals and beliefs of the people.

Mr. Arthur Keen, F.R.I.B.A., (Hon. Sec., R.I.B.A.) said in the days before the architectural schools it was not so much a matter of being taught as of learning for oneself, and that learning was chiefly obtained by the study of old buildings. At that time nothing was regarded as so important as the study of old work, and those who practised it successfully became good architects. He did not know what the education of Street, for instance, consisted of except diligent sketching and measuring. It was the accepted method of study, and it produced very good results indeed; whether those results were comparable with the results to be achieved by present methods of education remained to be seen, but the older methods were not to be thought lightly of when one thought of the results. However, if men with an aptitude for study were put through a proper scheme of education, it could not fail to raise the standard of their future work in a very marked degree, and the value of school training would be apparent in the general increase in the quality of work in the coming generation. He thought it was the duty of every architect to know all about Gothic work, whether they practised in it or not: it was a matter of the history of the country.

Mr. Gilbert Jenkins said the A.A. School did encourage the students to sketch and measure old buildings.

Mr. Philip Tilden emphasised the value of sketching from a purely historical point of view. Many of the City churches which were now threatened with demolition had never been measured, and he suggested that architectural students should consider it their duty to sketch and measure all old buildings which were threatened with demolition, so that a proper record would be left for posterity. He said in the north of England he had recently seen one of the most beautiful houses ever built being pulled down, and fire-places of William and Mary's time had been hacked down with pickaxes.

Mr. Keen pointed out that all Wren's churches were measured by Clayton in 1848, and there was a copy of the portfolio containing them in the A.A. library.

In replying to the discussion, the Lecturer said the methods of teaching at the A A. Schools were admirable, but he thought the students should supplement what they learnt at the school with what they could learn themselves by sketching and measuring old work. He urged them, however, not to trust slavishly to their sketchbooks, for there was nothing more annoying than to see a new building and recognsie features from other buildings.

MEETINGS.

Friday, *November* 30.

Glasgow Architectural Craftsmen's Society.—Dr. W. Carrick Anderson on "Stone Decay, Its Causes and Treatment." 7.45 p.m.

Tuesday, *December* 4.

Liverpool Architectural Society.—Mr. H. A. Welch on "Our Clients and Ourselves, and Possibly Other Thoughts."

Wednesday, *December* 5.

Reading Society of Architects.—Mr. W. E. Vernon Crompton on "The Renaissance and Modern Point of View." At University College, Reading. 8 p.m.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Origin and Evolution of the Ionic Order." At Southampton-row, W.C.1. 6 p.m.

Royal Archæological Institute.—Mr. A. Oliver on "Some French Abbeys and Cathedrals." At Burlington House. 5 p.m.

Leeds and West Yorkshire Architectural Society.—Professor C. H. Reilly on "New Buildings in Regent-street and the Strand." At Philosophical Hall, Park-row. 7 p.m.

Society of Antiquaries.—Mr. E. T. Leeds on "An Anglo-Saxon Cremation-burial in Asthall Barrow, Oxon." At Burlington House, Piccadilly, W.1. 8.30 p.m.

A CENTURY OF ARCHITECTURE IN VIENNA.

By H. V. LANCHESTER.

In wandering through the well-planned and spacious city of Vienna one receives an impression of ordered dignity and studied effects such as is only to be equalled by that great prototype of western capitals on the banks of the Seine. The vistas and massing of the latter are emulated by the groupings made possible when the Ring Strasse of Vienna was constructed through the wide glacis of the fortifications during the years following 1857.

No comprehension of Vienna is possible until this feature of its history is clearly recognised and its aspect prior to that date visualised. We find conditions which are without parallel elsewhere on anything like so extensive a scale—namely, a compact and intensively occupied central city, separated by a belt of half a mile in width from a ring of busy and wide-spreading suburbs which had begun to develop some two centuries previously.

In order to appreciate clearly the architecture of Vienna it is of first importance to understand its growth, and the two accompanying plans of Vienna before and after the formation of the great Ring Strasse will give a broad impression of the salient feature in this.

Without a clear recognition of this salient feature Vienna would remain a puzzle to anyone wandering through its streets, for the reason that after completing perambulations in the central city he emerges from it into surroundings so spacious and obviously modern that he will inevitably assume the growths beyond to be still more recent. Instead of this, on travelling outward, in almost any direction, he finds himself plunged once more into the Vienna of the eighteenth century, appearing in its general character more or less contemporary with the heart of the city, possessing important churches and great palaces, built in the Baroque manner of the period and with long radial highways and formal planning between them all solidly built up in the style characteristic of their date. Once given the clue, all becomes clear and obvious, but without it the solution would take long to arrive at.

The Rathaus.

Not only have the special conditions of growth affected Vienna in the mass, but their influence has also been manifested in the architectural treatment of its buildings, and thus, in dealing with this aspect, it was impossible to omit these very brief notes on the growth of the city as an introduction to the subject.

Prior to the formation of the Ring Strasse the course of architecture in Vienna had b more traditional than in most Continer cities. The great undertakings of the vious century, carried out in a vigor Baroque manner by Fischer von Erl Lukas von Hildebrand, and their pupils successors, had so strongly determined character of the place that the revival Greek architecture at the end of the eightee century left Vienna almost untouched. C the Greek temple in the Volksgarten and or two minor efforts in this direction are be noticed, while the general course contin the Baroque tradition, only eliminating more extravagant elements and drawing somewhat towards a more academic sever This might be termed the first period of century with which we are dealing, and Vienna at that time possessed within its w a strong school of architecture, this "A demic Baroque" might have formed a g starting point for future developments. S a school was, however, lacking, and when formation of the Ring Strasse, and the sk planning linked up with it, provided a se of magnificent sites such as has fallen to lot of no other city, the incentive to fill t sites with worthy buildings was bound induce an extraordinary activity in archi tural design, and we find as a result a se of buildings displaying a very high qualit artistic skill at every point as we circle ro the old city. Yet it is impossible for architect to feel the unalloyed satisfaction such an achievement should evoke; his n reverts to Paris, and to the consistent velopment of design there through almost whole of the nineteenth century; he may may not, according to his temperame regret that in lieu of a series of build carried through with a single dominant as to the meaning of architecture interpr by the mentality of the age, he finds a v able museum of the architectural forms expression of all types recognised by academies of that period.

The Burg Theatre (Semper and Hasena perhaps comes nearest to the manner w would harmonise Viennese traditions with modern spirit; but apart from this we in 1860 a sudden plunge into the second p of our period, and into a pronounced ecl cism which made a clean sweep of the traditions, and presented Vienna with

Vienna in the Eighteenth Century. (Fortifications removed 1857.)

ic Rathaus (Friedrich von Schmidt), the
e Church, the Greek Parliament House
Theophil von Hansen), the museums
per and Hasenauer) and university in
mic Renaissance, while the Opera House
a form of Renaissance which it is impos-
to define. Some of the other buildings
period are scholarly and others are not,
he position is to some extent saved by
massing and by the relative simplicity
teadiness of the masses of private build-
which fill in the less dominant sites. On
hole, the claim may fairly be made that
agnificence of the Ring Strasse would
been materially enhanced had the
ese school of architects during the latter
of the nineteenth century been able to
p a uniform and consistent ideal in
ecture instead of seeking expression in
r other of the styles which are recog-
as the outcome of various specific con-
s, and which, when placed in conjunc-
must necessarily emphasise the illogical
of their employment.

is probably due to the fact that the
ant electicism of this period was dis-
l in such an obvious way that towards
there was a movement towards a definite
ese style, not entirely uninfluenced by
emporary movement in Germany, but at
me time possessing the distinctive char-
stics of lightness and grace, while re-
g in the hands of the late Otto Wagner
ked severity of form and line.

drich Oman, as his studies show,
d his art more directly from the
ue tradition, but, except where de-
tely repetitive, he has entirely recast
nd evolved a technique of great plas-
bringing the art of architecture as near
ssible to that of the sculptor. These
rtists may be regarded as the pioneers
modern Viennese school, and they both
d from a strictly traditional standpoint,
eveloped their highly individual methods
y step from this. The younger archi-
owe a good deal to the efforts of these
en, but their example has not resulted
re copying, and while their sense of
has not been surpassed, more recent
pments are influenced by the increased
tance given to a form of design domi-
by structural methods. To the tradi-
st the results sometimes lack beauty,
ere is no doubt of their logical sound-
and the exponents of this school of
t can claim supporters in most of the
centres of art in Europe.

Vienna in 1880. The Ring Strasse.

As regards buildings for a definite purpose, the principles now inculcated seem to be leading to a very interesting phase in architectural design; but in purely symbolical or emotional forms they appear to leave their followers a little in the air, and to provoke experiments, many of which may be doubtful as representing the ideas intended to be conveyed. This is, of course, a danger to which every living art is liable to be exposed; it must away with methods that have become trite and hackneyed, while it is only to the rare genius that it is given to find a new mode of expression to replace these. The hope of the modern school in Vienna is that by experiment with new forms facility may be gained by means of which the genuinely imaginative mind may be aided in finding a mode of expression, but such a course must run the risk of encouraging many who may be capable of evolving sound work on recognised lines to attempt flights beyond their powers, and produce novelties that have no real meaning to justify the attempt.

Of course, but little has been built in Vienna during the past nine years, and there is no immediate prospect of important works in the near future; but such buildings as are now being constructed, mainly in the surrounding country districts, show a high standard of design is upheld.

Despite the departures in idea to be seen in the schools, most of the executed work shows its continuity with pre-war designs, and it can be claimed that the latest of the three phases of Viennese architecture during the century under review is still in process of evolution, and that, following the traditionalist period from 1820 to 1860 and the eclectic one from 1860 to 1890 or somewhat later, we arrive at a stage that, in so far as it is not typically Teutonic, can fairly be called a national one.

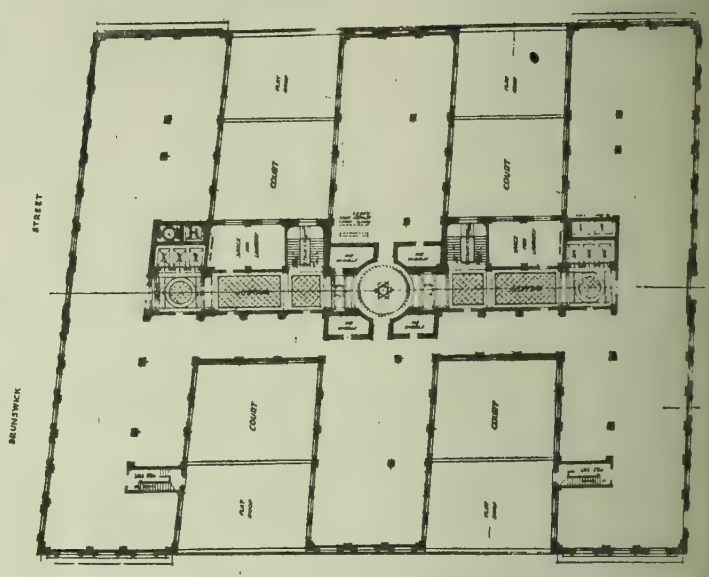
Design for New Premises for the Holt Line.

We give this week the design submitted in the recent competition for new premises for the Holt Line, Liverpool, by Messrs. Mewès & Davis. The selected design, by Mr. Arnold Thorneley, F.R.I.B.A., and Mr. Herbert J. Rowse, A.R.I.B.A., was given in our issue for October 12; and the designs submitted by Sir Edwin Cooper, F.R.I.B.A., and Messrs. Willink & Dod were given in our issues for October 19 and November 16 respectively. The design submitted by Mr. Curtis Green, A.R.A., was given in our last issue.

Harlington Parish Church.

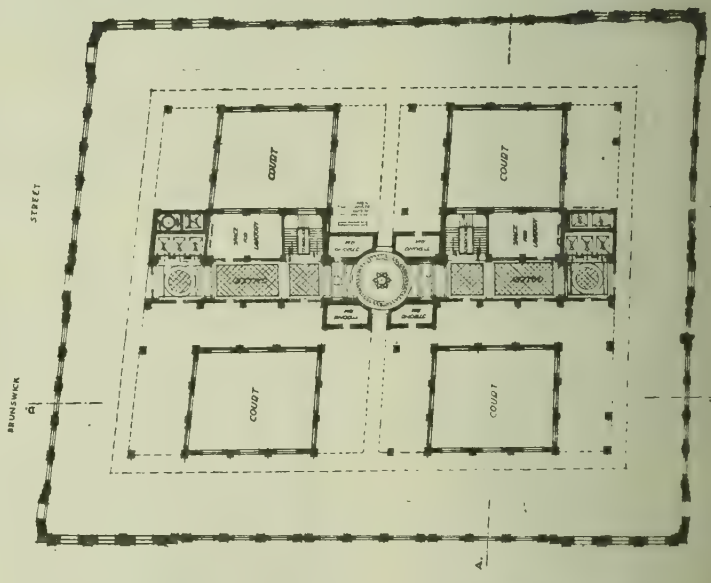
Some notes on Harlington Church, which is now being repaired under the direction of Messrs. Richardson & Gill, FF.R.I.B.A., are given on p. 849.

Paddington Baths.



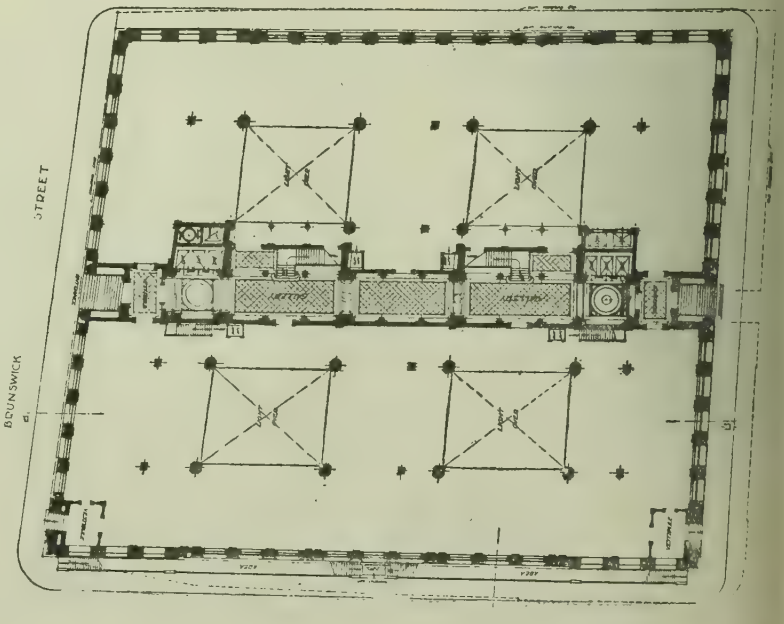
The New Central Baths, Paddington, are being erected at the north end of Queen's-road, on what is known as the Lodge Site, a portion of which, fronting Porchester-road, has been reserved for the erection of a proposed Public Hall, &c. The New Baths Buildings comprise first and second class swimming ponds, over sixty men's and women's slipper baths, public laundry with 30 tubs, establishment laundry, superintendent's quarters, &c. The first class swimming pond is being provided with collapsible dressing-boxes, and a temporary timber floor to enable this hall to be used in the winter months for entertainments and other purposes.

One of the problems was to design the main entrance to Queen's-road to meet the double needs of a baths establishment and a concert hall during part of the year without the working arrangements for the one interfering with the arrangements of the other.



Three Paxman's economic boilers are being installed in connection with the heating, hot-water, and generating plant. The engineering contract is being carried out by Messrs. Z. D. Berry & Sons. The new front to Queen's-road is being built in Cornish granite, Portland stone, and 2 in. purple and red facing bricks.

The general contractors are Messrs. Perry & Co. (Bow), Ltd., the sub-contractors including Messrs. Archibald D. Dawnay & Sons, Ltd., constructional steelwork; Messrs. Siegwart Fireproof Floor Co., Ltd., concrete floors and flat roofs; Messrs. Empire Stone Co., Ltd., reinforced concrete ponds; Messrs. Farnley Iron Co., and Leeds Fireclay Co., glazed bricks; Hathern Terra Cotta Co., terra cotta work; Messrs. Williams Gamon & Co., Ltd., steel and bronze casements. Messrs. Gilbert Seale are executing the stone carving.



The architect is Mr. Herbert Shepherd, F.R.I.B.A.

EXHIBITION NOTES.

TOWN PLANNING AT OLYMPIA.

WITH twelve thousand square feet of wall space and half an acre of floor Major Hardy, Syms has been able to arrange the most interesting exhibition of Town Planning at Olympia which has probably been seen in London. The whole exhibit is well schemed in sections, beginning with the Civic Survey (1), and showing (2) Town-Planning Schemes under Town-Planning Acts, (3) Road Forms, (4) London, (5) City Development, (6) Regional or Joint Town Planning, (7) Garden Cities, and (8) Parks, Playgrounds and Athletic Grounds. There should be few architects who would not be interested, and may we not say instructed, by a careful consideration of this accumulated mass of information. Much of it has been actually collected by Major Hardy-Syms from Hungary, Austria, Sweden, Germany, &c., and a review of what has been collected would show that we have much to study, admire, and emulate in what far distant cities have done. That this exhibition might have been larger and more comprehensive still, we do not doubt, but it is sufficiently up to date and vital to make it for us the most interesting we have seen.

The sequence of action following a civic survey may be well understood if the visitor to the exhibition follows the various sections in the order they have been placed. As an instance of the practical application of town-planning design, we may point to the clever plans and elevations which have come from the London University School of Architecture and the A.A. schools. A quite new type of building, called for by modern developments, is the Motor Charabanc Station, which was suggested as a subject to the schools, and has met with an admirable response.

In the space at our disposal this week we cannot do justice to an exhibition so full of interest. It was stated by a public speaker the other day that there was no plan of London. A contradiction is provided here by the fine exhibit of plans by the London Society, dealing with Stoke Newington, Bethnal Green, Stepney, Hackney and Islington, and plan of roads in and out of London by the organising secretary.

The study of town development is illustrated by a fine series of drawings of Manchester as it was, as it is likely to be, and as it might and should have been. A wonderfully interesting series of drawings shows how a beaver altered the history of the town of Newbury. There was a river ford over a thousand years ago where roads met, and where building had begun, but one day a beaver or beavers set to work and built a dam across the stream further to the east, so that in time its ledge formed a better crossing of the river than the ford, and thus after the formation of a Roman camp this became the centre of the present town.

Bath, Birmingham, Oxford, Bolton, Blackpool, Dundee, Lancaster, Rochdale, Leicester are all shown together in an interesting section of the exhibition. Ramsgate's sea-front as propounded by Sir John Burnet & Partners, and Messrs. Lancaster, Lucas & Lodge, occupy another section.

The map designed by Mr. Pepler, showing a system of notation for the plan of a town in regard to its various aspects of density of population, location of industries, &c., is a valuable contribution. A map of England and Wales, showing the town-planning schemes already projected, in operation, or hereafter necessitated, gives a vivid impression of how much there is to be done. And whilst all this is before us it is interesting to see in various sections how vigorously the subject has been already dealt with in other countries, in some cases with very marked success.

The model which shows a design for a new bridge at Charing Cross should be useful in showing what such a scheme could produce; perhaps some will find it attractive. There would certainly be good space for all-night shelters under the embankment arches of the bridge, which will also serve to cut off the present fine view up and down the embankment. The model suggests, apparently, giving the south side over to dull, severe-looking types of commercial buildings.

A floor model 220 ft. long and 20 ft. wide, of the Great West Road out of London, occupies one end of the Gallery, and perhaps the large scale helps one to realise the great extent of the work. There are 22 models of various kinds, of which the most interesting is Mr. Barry Parker's development scheme for Oporto. Other excellent ones are No.16, of the Flackwell Housing Estate (W. S. Grice, architect), showing a pleasant lay-out, Bourneville and Gothenburg.

The graphic illustrations of Bournemouth, Bellingham, Golders Green, Welling (housing), Marsh Green, Merton, Barking, Hampstead, Mitcham and Hendon, will perhaps seem rather lacking in quality and originality compared with Zurich, Gothenburg, Upsala, and other Continental examples, but most British citizens may well feel assured that in the expression of pleasing domestic feeling in architecture we have really nothing to learn from other countries.

A valuable volume might be compiled from the materials got together in this one exhibition, but books are only one of various methods for the spread of knowledge. What we should like to see would be a series of lectures in all our towns dealing with town planning treated in a summarised and popular form, so that the general public—the so-called cultured and the rest!—might realise what goes to the making of a beautiful, healthy and well-ordered city. How many are there who realise what has been done so well in Liverpool for the better arrangement of tram roadways (shown in a fine photograph at the exhibition), or what the system of, transport fares and routes has done for Paris shown in a graphic map! Underlying or overlaying all the many activities which are necessarily associated with town planning, how many people are there who realise the sociological point of view? For our own part we frankly admit our already keen interest in this great matter of efficient town development has been stimulated greatly by this exhibition, which owes so much to the able committee in charge of it and the discriminating industry of its organising secretary.

BROMHEAD NURSING HOME, LINCOLN.

THIS building (see p. 847), called "The Red House," was erected from plans prepared by Mr. Wm. Watkins, F.R.I.B.A., in about the year 1887. It has been added to from time to time. The recent additions indicated in black on the plan were made in order to meet the growing demand for additional private nursing home accommodation. It consists of a waiting-room, five private wards, together with a maternity section, including maternity nurse's bedroom, and sanitary arrangements and lift on the ground floor; five more private wards and the operating theatre section, which comprises an anæsthetic room leading into the operating theatre, with the surgeons' cloakroom and surgeons' preparation room and nurses' preparation room on either side, and sanitary arrangements and lift form the first floor.

The plans of the theatre section were designed in accordance with the latest views on the requirements of aseptic surgery. The theatre itself contains only the absolute necessities, instrument cabinets and other equipment being kept in the subsidiary rooms. The surgeons' cloakroom and nurses' preparation room are shut off from the theatre by doors, thus ensuring the passage of the least possible amount of dust from the outside corridors into the theatre itself.

The walls of the operating theatre and surrounding rooms are finished in Portland and Parian cement and painted in enamel, the dado being dark green and the remainder white. The floor is dark green mosaic, this colour being chosen specially to throw up objects contrasted against it. The floors of the anæsthetic room and sanitary rooms are covered with doloment. The doors between the anæsthetic room and the operating theatre are solid enamelled doors, self-closi rising butts, and are cut short both top and at the bottom, the former for v tion and the latter to prevent the mo of dust. Special curtains and sha opaque black material have been arran use in the anæsthetic room, which n darkened for operations requiring the The ward floors are covered with " ship " linoleum stuck down to the conc

In addition to the low-pressure apparatus it was thought advisable small " Devon " grates in the different for ventilation and additional warming elevations, which are of a plain and character to harmonise with the o building, are faced with local facing and the roofs are covered with Ro tiles. The whole cost of the additio been about £7,500.

Messrs. Wm. Wright & Son (Li Ltd., were the general contractors. W. Gregory & Son, of Lincoln, the el engineers concerned, and the Brightsi gineering Co. carried out the heating the architect being Mr. Henry G. G F.R.I.B.A., of Messrs. Scorer & G architects and surveyors, Lincoln.

RENAISSANCE GARDE AND TOWN PLANS

FOLLOWING is a summary of the sixth series of lectures on Town Planning, giv Mr. Wm. Haywood, F.R.I.B.A., at Birmi University :—

The influence of landscape architecture Renaissance town planning was more ap in seventeenth-century France than in teenth-century Italy. Italian gardens fa the hill side, and the prospect of great n effects external to their boundaries. I gardens were horizontal, and were asso with distant landscapes, where these co made to appear as part of an artificial

Le Notre, the greatest of French lan architects, was responsible for the best I work between A.D. 1661 and 1700, includi gardens of Versailles, St. Germain-en Trianon, Marly, and St. Cloud. Versaill especially interesting, as it had formally-pl gardens on the west front of the Palace, formal planning of streets and buildings east; the composition in each case centr the Chateau. The Place d'Armes, around the Palace and town were grouped, had c and branching avenues, evidently inspir the plan for the Piazza del Popolo at built eighty years before. This feature a appeared in Germany at Karlsruhe (A.D. where the geometrical association of town Palace, and Palace gardens—which Ver uses with discretion—was carried to extremes. Neither at Versailles nor else did any town planning appear in the seventeenth, or nineteenth centuries, which compare with Wren's plan for rebuilding L in 1666. For spacious effect, and a utility to its own and later times, this plan alone, and there was no greater lesson learned from the history of town planning the loss suffered by London from an absen legal power at a time of great opportunity.

Paris—to which one's thoughts t naturally when one thought of cities planned and adequately built—was the out of many apt adjustments, rather than comprehensive design. Her first move to emancipation from mediæval congestion occ with the use of her seventeenth-century fications as promenades, and their subse adaptation—when removed by Louis XI tree-lined avenues. This sweep of av on the north bank of the Seine, known la the "Grande Boulevards," was the first towards modern planning in Paris. It conceived 85 years after Fontana's wo Rome, and 10 years after Wren's plan London. Paris had profited greatly b successive enclosures.

E ARCHITECTURE CLUB.

hursday last, at the Hotel Cecil, the ture Club held its fifth quarterly dinner. hair was occupied by Mr. J. C. Squire, ongst those present were The Hungarian . Lord Riddell, Viscount Bury, Sir Cewnes, Sir Charles Walston, Sir Hugh r Theodore Cook, Sir John Hall, Sir Biron, Mr. Hope Bagenal, Mr. Oswald Mr. R. S. Bowers, Mr. Ewart G. Culpin, F. W. Dening, Mr. W. Reid Dick, Mr. . Eagar, Mr. A. Trystan Edwards, Mr. ler-Duncan, Mr. H. M. Fletcher, Mr. G. Forrest, Mr. W. A. Forsyth, Mr. H. S. -Rendel, Mr. Edmond Gosse, Mr. E. Hall, Mr. H. Austen Hall, Mr. Stanley Mr. Ambrose Heal, Mr. Lewis Hind, les Holden, Mr. Ralph Knott, Mr. H. V. er, Mr. Nathaniel Lloyd, Mr. Edward Ir. Oswald P. Milne, Mr. Ian MacAlister, . Newton, Mr. Paul Phipps, Mr. A. R. Mr. Howard Robertson, Mr. Charles Mr. Philip Tilden, Mr. T. S. Tait, . Walkley, Mr. John Walter, Mr. Paul ise, Mr. Trenwith Wills, Professor J. Worthington, Dr. Thomas Worthington, . P. Maule, Mr. R. S. Bowers, Mr. Wyon, and Mr. F. R. Yerbury.

he loyal toasts, the CHAIRMAN gave a ort of the progress of the Club. The had, he said, been very evident of late ncreased attention which the press and e paid to architecture. The member- he Club was increasing, and its sphere y was extending. They had received ort of the architectural profession and Royal Institute of British Architects, ch body the Club was co-operating in g an exhibition of architecture at next itish Empire Exhibition. That Exhi- ould include photographs of a repre- selection of the best buildings erected e Empire during the past twenty years. committee of the R.I.B.A. and the been formed, and he hoped it would le to place the Press Committee of the the disposal of the Royal Institute. b now had three sub-committees in order: (1) the Press Committee; Lecture Committee, which would lectures on architecture in various parts ountry; and (3) the Exhibition Com- which was organising the second Exhi- the Club to be held in the Spring of r. In future those exhibitions would ections devoted to the best architecture preceding twelve months, housing gardens, memorials, &c.

OMUND GOSSE, proposing the toast of ecture," expressed the pleasure he from seeing beautiful buildings, and although he had travelled extensively ings appealed to him so much as the ical buildings of France, particularly hic cathedrals of the twelfth and h centuries in the north of France. ad splendidly preserved her memorials st. In the seventeenth and eighteenth there was considerable opposition to Gothic minsters of France, and there anger that many of them might have nolished, but that could not happen use they were protected by legislation. very serious thing that there was no legislation to protect architectural ces of the past in this country, and itecture Club might do a great deal to the magnificent buildings which were langer of being lost to us through the of industrial arguments, particularly r of the City churches. Probably the rches were not all as beautiful as Ely l, but they were all works of art and ought to be judged on its own parti- erits. Never in the history of our on had a beautiful ancient building troyed without it had been regretted ds. If one of the beautiful City were destroyed it would be gone for l it was possible that the next genera- tion, finding the building had beauties not now realised, would hold the present generation up to execration. It must be realised, however, that industrial necessities existed, and that every building was not worth preserving simply because it was old, but every movement to destroy an ancient monument should be carefully watched.

In responding, Mr. PAUL WATERHOUSE, PP.R.I.B.A., expressed the pleasure he felt at the existence of the Club, whose aim was to blend together architecture and literature. There was much that literature could do for architecture, and no doubt architects could do something for literature.

The toast of "The Club" was proposed by LORD RIDDELL, who said it was a melancholy fact that there was no subject on which the general public had less knowledge than architecture. Very few of the public knew anything about the important buildings in the towns in which they lived, and fewer still knew anything about the architects who designed them. That ignorance was largely due to architects themselves, who were a very reserved body of men. So far as he knew no architect had yet been bold enough to put his name to a building he had designed. He was quite certain that architecture would never become popular, nor would the public take an interest in architecture, until architects took the trouble to advertise themselves more in the editorial columns of the press, by speaking, and in other ways. In addition to interesting the public in architecture he thought the Club might do good work by inculcating better business methods into architects. The system of treating architects as artists rather than business men had its defects. What frightened many people from building was the possibility of "extras," and it would be to the benefit of all concerned if a client were told exactly what a building would cost without the fear of any extras unless incurred by the client himself varying the design whilst the building was in progress of erection.

Mr. A. B. WALKLEY responded.

HARLINGTON PARISH CHURCH.

THIS is a well-proportioned building; the chancel measures 32 ft. by 16 ft. 10 in., with, north vestry; nave 55 ft. 8 in. by 18 ft., with aisles 7 ft. wide, and a characteristic porch; the west tower measures 9 ft. 4 in. by 11 ft. 7 in. internally. Both the nave and aisle are fine examples of early fourteenth-century work; the chancel is of slightly later date. There was no tower to the original design. In the fifteenth century the present tower was added and, without regard to constructional needs, was built against the west wall of the nave. The nave arcades are fine examples of their type, being tall and slender with moulded details; in this respect the work is similar to that at Houghton Conquest Church.

All the original windows have been removed from the aisles with the exception of one in the east wall of the north aisle. There are remains of a similar west window, now blocked. The uncusped sixteenth-century windows of four lights in the aisle, and elsewhere of three lights, have the character of early Tudor work.

In the fifteenth century, probably when the tower was added, the aisle walls were heightened, and low-pitched roofs finished with lead flats were put over the nave and aisles; the line of the high-pitched fourteenth-century nave roof can still be seen in the west wall of the tower. This portion of the nave wall is built of clunch and was evidently exposed to the weather for centuries, after the alterations were made. The exterior was repaired about ninety years ago.

In the chancel there is a three-light east window with flowing tracery of original date (probably *c.* 1345), flanked by fine contemporary gabled and pinnacled niches revealing the influence of Walsingham's work at Ely (the northern niche is richer than the other).

In the north wall of the chancel are two two-light windows equally spaced with a fifteenth-century vestry door between them, and in the south wall are two similar windows set close together at the east end of the wall with a small door farther to the west, and at the south-west a small square-headed low-side window, all of original date and all having moulded arches of the same section. A plain seat below the south-east window and a locker in the north wall are evidently original work. The jambs of the chancel arch have towards the nave clustered half-responds of the same build and detail as the nave arcades, but towards the chancel are rough blocks of masonry, perhaps the remains of the side walls of an older and narrower chancel against which the 14th-century work was built.

The upper stones of the outer order of the arch on the chancel side appear below the chancel ceiling which hides the rest of the order; they are worked with a deeply-cut thirteenth-century section.

The nave has fourteenth-century north and south doorways of moulded detail, the latter under the fifteenth-century porch, and in the tower is a third doorway in the west wall, of Decorated date; in fact, the stones may have been moved from their previous position under the wall of the nave.

The tower opens to the nave by a fine moulded arch of two orders of fifteenth-century date, and has a two-light west window. The staircase is at the south-west angle. The chancel roof is modern, but the tiles are old, probably early eighteenth century. The roofs of the nave and aisle are of the fifteenth century and have simple moulded timber with bosses at the intersection and wall posts.

At the west of the nave several rows of late Gothic benches, with buttressed ends with fronts and moulded rails, are still extant, but otherwise the woodwork of the church is modern, except for a seventeenth-century chest and a chair dated 1601.

In the north aisle is a flat arched recess, apparently early seventeenth-century date, which must have once held a monument. This now contains the war memorial tablet.

The whole of the church is to be repaired under the direction of Messrs. Richardson & Gill, of London, whose report is to be considered by the Society for the Protection of Ancient Buildings. **Drawings of the tower are given this week.**

THE ARCHITECTURE OF OXFORD.

UNDER the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch), a lecture on "The Architecture of Oxford" was given recently, by Mr. W. S. Purchon, M.A., A.R.I.B.A., head of the department of architecture and civic design at the Technical College, Cardiff. Mr. J. E. Turner, J.P., was in the chair.

The lecturer explained that he selected Oxford for his subject partly because the forthcoming Conference of the R.I.B.A. was to be held in that city, but mainly because carved in its stones was a record of English architecture from its early beginnings to the present time. It was difficult, he said, to over-estimate the influence of that architecture on those who had studied at Oxford. Having expressed regret that modern developments in Oxford outside the Colleges were not more worthy of the noble traditions of the city, the lecturer proceeded to consider, in chronological order, some of its leading buildings.

He pointed out that it was often only lack of funds which saved fine Gothic work during the Renaissance, and that the architects of the Gothic revival often had as little respect for Renaissance work, but that the attempt made in 1910 to pull down Butterfield's Gothic Revival Chapel at Balliol was frustrated.

LEEDS & WEST YORKSHIRE ARCHITECTURAL SOCIETY.

In his Presidential Address to the Leeds and West Yorkshire Architectural Society, held on November 23, Mr. Eric Morley, F.R.I.B.A., F.S.I., said the last R.I.B.A. elections revealed an altogether new feeling amongst its voting members and marked still another step forward, and the number of provincial architects now serving on the Council was larger than ever before. It must be apparent to all that the provincial members of the R.I.B.A. would now be able to secure their demands at any future election, if only their full voting power were exerted to do so. Most important of all, and for the first time in history, they had elected a provincial architect to the chair of the Royal Institute. They would not then be unduly sanguine in fostering the hope that they were at last coming into their own. It only remained for each one of them to ensure his further advancement and to grasp the opportunities to his hand.

Nothing had affected so vitally the street architecture of this country as the crying demand for glazed acres of shop windows. It was the shopkeepers' one essential for successful trading, and even the most conservative of architects had been compelled to modernise his ideas and to modify the scale of his elevations to provide it. That had been achieved by the shopkeepers, but the shortage of office accommodation, calling equally for attention, was surely another example of the suddenly apparent and devastating troubles which appeared as a result of the war. The only possible solution was higher buildings. He was not advocating skyscrapers 600 ft. high, but buildings of from six to eight stories. A great deal had already been said on that subject, both for and against, but it appeared to them in Leeds and Bradford, at any rate, expansion in an upward direction was both desirable and inevitable. Any town with a limited central area, with a limited number of streets suitable for offices near the important centres of civic and industrial life, had its business locality finally restricted or confined so as to make lateral extension, except on the very smallest scale, almost impossible. The width of streets was, of course, a governing factor, but the recent case of Charles Semon & Co., Ltd., *v.* Bradford Corporation had established one fact for their guidance; that a building half as high again as the width of the street would still leave a sufficiency of light for the opposite owner.

There was little doubt that since the war the number of clients who inclined to the desire for higher buildings had increased, but there again a note of caution in dealing with them was essential. It was not usually feasible to erect such buildings on small sites, for the reason that the proportion of area required for lifts and staircases was often too great to ensure a sound financial undertaking. Sites must be sufficiently large to provide those necessities with economy, and the interests of a city were better served by one owner selling to, or sharing with his neighbour, than by either covering his own small site with a building not really suitable for the position it occupies.

Last year he visited the school of art whilst the preparation of designs for the front of a large post-office was in progress. He was amazed at the high standard of excellence in that room, and, though it occurred to him that the importance of scale and proportion as a preliminary essential for a façade of that description had possibly escaped one or two students at the outset, he felt really envious of the facilities the school provided. In spite of all that, he would say one or two words of counsel to the students. He would remind them that the nature of their earlier work would not, for the most part, include at all the planning of great monuments or the erection of buildings with imposing façades. It would rather consist of the alteration of houses, the building of garages and other very much smaller contracts. But should they feel disappointed or disheartened at the lack of public confidence that might seem to reflect, it would help them to remember that even garages were of two kinds—good and bad—and that it was just as essential to do their best with the smaller buildings as it was to achieve greatness with the larger. There was nothing so true in the architectural profession as that only the best was good enough, that success was only achieved by giving constant attention to the very smallest detail. If young architects gave this requisite attention they would have more work than they could do, and when that time arrived they would do well to have grasped early two other points of importance. First, they should cultivate strenuously the faculty of quick thinking, of coming quickly to a decision. Every architectural problem had a variety of solutions, and many of them must occur to every architect as he tried to evolve a design. Second, however sound and thorough their training, and however inviolable their position as architects, a good builder was their best friend. Remembering that the autocratic and dictatorial architect was not always the ideal, they should see that they worked actually with the builder and not exclusively apart from him. They should consult him whenever his experience would be of value. Fresh from the school, they will be gifted with a range of knowledge by the side of which that of the average builder appeared limited and unimportant.

The prizewinners in the Society's Competitions are as follows:—

SILVER MEDAL (for MEASURED DRAWINGS).—Mr. G. A. Burnett.

DESIGN.—(1) Mr. F. Chippendale; (2) Mr. George W. Alderson.

THE "HALDEN" PRIZE ESSAY.—Mr. F. Chippendale.

THE SOCIETY'S TRAVELLING STUDENTSHIP FOR 1923.—Mr. F. Chippendale.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

The following are notes from the Minutes of the meeting of the R.I.B.A. Council on November 19:—

TOWN PLANNING.—It was decided to circulate a memorandum on the subject of "Architects and Town Planning" to all Members and Licentiates and to the Allied Societies, with a request to the latter that they should use their influence to bring it to the notice of the Local Authorities in their districts.

HOUSING FEES.—A Committee was appointed to draft a new Scale of Charges applicable to Housing Work under the Housing (No. 2) Act, 1923.

THE R.I.B.A. LIBRARY.—A Committee was appointed to consider and report on the question of better and safer accommodation for the R.I.B.A. Library.

APPOINTMENT.—Mr. Digby L. Solomon was appointed to represent the R.I.B.A. on the Sectional Committee on Cement of the British Engineering Standards Association.

PROFESSIONAL CONDUCT.—A member was censured and suspended for six months for quoting fees lower than those prescribed by the R.I.B.A. scale when applying for appointment as architect to a public authority.

THE FRANCO-BRITISH UNION OF ARCHITECTS.—It was decided to make an annual grant of £20, to meet the expenses of the British Section of the Franco-British Union of Architects.

MEMBERSHIP.—The applications of four candidates for the Fellowship and two candidates for the Associateship were approved.

RESIGNATIONS.—The following resignations were accepted with regret:—J. Coulson Nicol, K. Gammell.

The Oldest Orphanage.

Sir James Carmichael, K.B.E., will preside at the 165th anniversary festival of the Alexandra Orphanage and Orphan Working School, to be held at Salters' Hall, E.C., on Tuesday, December 4.

READING SOCIETY ARCHITECTS.

"The Mediæval Point of View."

THE third of the course of four lec architecture, arranged by the Reading of Architects in conjunction with the Branch of the Workers' Educational tion, was given at University College, on Wednesday last week. The chair w by Mr. W. Galt Millar. F.S.I., the Chai the Executive of the Reading Society tects.

The lecture, which was on "The M Point of View," was illustrated by lante The lecturer, Major H. C. Corlette, F.R.I.B.A., began his address by to the evidence of a continually ing tradition of building through all pe history, which was, he said, to be see relationship of Greek and Roman ideas to one another and of both to earlier E forms. He then showed that all m building was related to Roman work e direct influence or through the work Byzantine builders, but the mediæval view grew rapidly away from both influences and moved on to the use methods unknown before. It was not ap a conscious view but rather an attitude an instinct of freedom, that enabled t make discoveries. They were practic working men, not moved by weak emoti stirred by energy of mind and body to o new problems of structure by every a scientific device they could use. But spirit of enterprise, of experiment, they a all questions, whether of government, ministration, or of building. By doing discovered the practical superiority pointed arch over other forms as a m which to solve the special difficulties p to them. In the result they produced wonderful varieties of Gothic architectur this Gothic work, which in itself was pression of their sense of freedom, of was used under organised and appro straints. In the northern parts of Euro built as the climate required and the m available allowed, and in the south they the same considerations of sense to i them in their work. Geography left pression on their architecture. They copied others who had built before th they never initiated their own successes

The influence of the mediæval point was not confined to a period from, say, th to the fifteenth century; it extended, es in England, till the end of the sixteenth and later, and during the latter part period the Gothic mind was at work menting, with wonderful success, on t and more modern problems of planni design. Gothic architecture was not a t religious impulse or feudal demands, or of traceries and cusps, or any other pa details. It was more an attitude of mi attacked questions of building with sonn converting all difficulties of plan or const into something usefully beautiful. T among the craftsmen was its backbo operation among them gave it power. T guilds were a school of workers. They fact, a "workers' educational associatio they lived and learned not only by boo words but by the things they could tou see, always searching for ideas of perfec means of action and adventure, experim enterprise. The mediæval point of vi duced achievements which have neve equalled in beauty nor surpassed in br of intellectual power.

Exhibition of Decorators' Work.

An exhibition of decorators' work held at the School of Art, Mount-street, pool, from December 5 to December 1 sisting of travelling exhibition works from those shown at the recent exhibiti in London by the Decorators' Federati much local work.

ERIES OF ANCIENT STAINED GLASS.

A. KNOWLES lectured before the ety of Arts on November 21 on t. The Earl of Crawford and K.T., P.C., F.S.A., presided.

urer said there was no greater ll true lovers of old work and old ip than the forger. Even those othing of the joy of possession, the essence of collecting, but who ake a living, and an honest one, and selling, the forger did the rm. They were very frequently his d his productions turned up so in auction rooms that both private and dealers were very shy of bid- nething that might eventually prove lless. Therefore, sometimes abso- ine specimens were passed over, or small figure. Unfortunately glass ject which was little understood, here might be scores of people who le of giving expert advice on an g. and hundreds of others who had udgment to exercise a very sound n such cases, those who were simi- pped with a knowledge of glass ere comparatively few.

as a comparatively fragile material. pport of this statement the lecturer d not been made without due consideration. One could not but r example, that pieces of glass were to be seen, such as those in St. Spurriegate, York, of the most d shapes to cut and glaze, which ined intact for hundreds of years break or crack in them. Other were the quarterings of the shields seen in English and French ass, where the charges, three fleurs- d been let into a piece of blue glass three lozenge-shaped holes had been d cut to receive them, yet the glass ined intact until this day.

. the lecturer said, was an iniqui- eeding, inasmuch as it was an o extort large sums of money under ences. Forgers frequently bought of glass from old windows, and n them so that, though the glass aratively old, the painting was new. ine whether or no a glass painting rgery, a thorough knowledge of the history of the art was very im- for it was in this, and not in dex- and, that the forger most frequently self away, through not knowing at ods the various improvements in the and methods of working were intro- A glass painting that showed, for the use of yellow stain before the of the fourteenth century was in st degree likely to be a forgery, for st known example was dated about 1310—the Peter de Dene window in of York Minster.

The Glass.

inting of a forged panel might have skilfully executed as to deceive an But unless the glass upon which it done exactly corresponded in every with glass of the corresponding hat to which the forgery pretended it had to be rejected. The various sties which it might possess were the difficulties of finding glass at day which would agree with all of great. The material on which the had been done must agree in (1) 2) texture, (3) waviness, (4) tint. to stain without metalling.

The Enamel.

xt point, the lecturer said, was the of the enamel with which the glass painted, and by enamel he did not ured enamels, but merely the opaque brown, red or black pigment which was used for painting the outlines and giving the various tones and shades of the painting.

What glass-painters termed "foxiness" was a curious reddish cast communicated to the painting, to be seen when it was viewed from an angle instead of from a point directly in front. There were two forgeries of the sixteenth century which showed this. Generally speaking, modern enamel was greatly inferior in density to the old.

Coloured Enamels.

The lecturer then discussed the question of coloured transparent enamels—blue, red, purple, etc.—which were generally applied to the back of the glass. As a rule it might be generally laid down that, except in some few exceptional cases, the old enamels were never equal for brilliancy and transparency to those of the present day, and especially to those enamels of Continental origin. All this favoured the detection of fraud, for most of the forgeries of the present day were being made on the Continent, and the producers of them employed enamels of French or German make, which, no matter how superior they might be to the ancient ones, did not match them nearly as well as the English enamels did. Ancient enamels were very hard, but modern Continental enamels, on the other hand, were very soft. English enamels were much harder, and the colours were not so brilliant, but the forgers of glass were not generally aware of this fact.

Technique of the Painting.

The lecturer then dealt with the important question of the painting or "handling," as it was termed in oil painting. It was safe to say that a whole book might be written on the subject, and then all would not have been said. All he could do would be to lay down one or two main points of guidance. As regarded mediæval glass, the chief characteristic of the period was the tracing. Though much inferior work was produced, it would be a matter of the utmost difficulty to imitate the freedom and the endless variety of width in the traced lines in the best old work. There was one characteristic of technique which glass of all periods from the earliest to the latest must possess, and it was this: It must not have been passed through the kiln more than once. Although the lecturer said that it was always dangerous to dogmatise on these matters, and that he would not be at all surprised if some day an undoubtedly authentic specimen of ancient glass turned up which showed unmistakable evidence of having been fired more than once, and the painting carried further before the glass went into the kiln a second time, one could not be surprised at anything in stained glass. He had every reason to believe that the east window of St. Margaret's, Westminster, was a repainting by an eighteenth-century artist on the top of early sixteenth-century work.

Abrasion.

The lecturer then dealt with abrasion, and said that ruby glass had always been manufactured (and at the present day still was, except in one or two very exceptional cases) in a different way from the other coloured glasses. Instead of the sheet being coloured all through, the red laid in a thin film on the surface like the gelatine film on a photographic plate, the colourless glass beneath merely acted as a support. It was a great temptation to the forger to use acid, on account of the ease and speed with which it could be employed, but the edges of the film should be examined, and if they showed that acid had been employed the piece should be regarded with the gravest suspicion. Before the use of acid the red film had to be ground away with a grindstone or with either a copper wheel or an iron instrument and some abrading material such as sand or emery. It was obvious that by such a method it was impossible to leave a sharp, clean edge.

Corrosion.

Old glass was frequently corroded. Many people thought that a piece of glass could not be old if it were not corroded or pitted, but this had nothing to do with age. For example, they had two heads from the same subject, viz., the Coronation of the Blessed Virgin, in St. Helen's Church, York. The one was in a bad state of decay, the other not touched. They were both of the same age, and had both been subject to the same atmospheric conditions, yet the one was preserved, while the other was in an advanced state of decomposition on both sides. The causes of decay in glass were nowadays well understood, and the whole subject had been thoroughly treated in a paper by Mr. Noel Heaton (*Journal of the Society of Arts*, No. 2,834, March 15, 1907).

Swiss Glass.

Finally, the lecturer dealt with the subject of Swiss glass, and said that no glass was so much sought after as Swiss panes. Unfortunately there was not much of it to go round, and practically all the best pieces had long ago passed into public or private collections. This had led to a large number of forgeries of Continental origin appearing in antique dealers' shops and in auction rooms; the manufacture of them was almost a small industry. The skill, however misapplied, with which they were executed was amazing. Some specimens had even found their way into national collections, so that it was hopeless for the amateur to try to detect the good from the bad, as this would often tax the wits of the greatest experts. One of the most skilful of these forgeries was at Düsseldorf.

In conclusion, the lecturer said it was a great mistake to get into the habit of suspecting everything one saw, like a child who imagined there was a bear lurking in every dark corner on the way to bed. This was an attitude of mind to which experts were very prone; so that eventually they came to suspect their own shadows. Pieces which were offered at a reasonable figure were generally either perfectly genuine, or of the class of obvious shams which were turned out by hundreds.

Royal Sanitary Institute.

The next Congress of the Royal Sanitary Institute will be held at Liverpool from July 14th to 19th, 1924, by invitation of the Lord Mayor and City Council.

LEGAL SECTION.

NOTES ON CURRENT CASES.

Lease Breaches of Covenant : Forfeiture.

We have lately noticed one or two decisions on forfeiture for breaches of covenants in leases, and the most recently reported case is Civil Service Co-operative Society, Ltd., *v.* Trustee of Sir J. R. D. McGrigor, Bart. (1923 2 Ch. 347). In that case the plaintiffs had demised certain premises to the defendant and another on a lease for 35 years at the yearly rent of £700 and a further sum as rent for hot water and heating the radiators. The lease contained covenants by the lessees to pay the rent and not to assign, underlet, demise or otherwise part with the premises or any part thereof, or any estate or interest therein without the consent in writing of the lessors, which consent should not unreasonably be withheld. The proviso for re-entry provided that if the lessees should be in arrears with the rent or any part thereof for 21 days after they had become due, or if the lessees should at any time fail to perform, or neglect to perform, any of the covenants or agreements of the lease to be performed by them, or if the lessees should at any time during the term become bankrupt or have a receiving order made against them, then it should be lawful for the lessors to re-enter. This lease was dated November 6, 1914, and on October 18, 1922, the lessees had presented their petition in bankruptcy and on the same day a receiving order in bankruptcy was made thereon, and on October 24, 1922, on the application of the official receiver with the consent of the debtors they had been adjudicated bankrupt, and subsequently the trustee in bankruptcy had entered into possession of the demised premises without opposition on the part of the bankrupts and without having to obtain any order requiring them to give up possession.

On November 13 the plaintiffs served a notice upon the defendants and upon their trustee in bankruptcy setting out the terms of the lease and giving notice that upon the expiration of 14 days from the date of the notice they intended to enforce the right of re-entry or forfeiture.

On November 28, 1922, the writ in the present action was issued claiming a declaration that the plaintiffs were entitled to recover possession of the premises as on a forfeiture of the lease, possession and mesne profits, on the grounds of (1) breach of covenant against assigning or parting with the premises and (2) bankruptcy. It may here be mentioned that on December 28, 1922, the defendants received from the plaintiffs a written demand for £203 15s. addressed to the liquidators, made up as follows : Rent to December 25, 1922, £175 ; rent of radiators, &c., £9 3s. 9d. ; water rate, £19 11s. 3d. and a cheque for the amount signed by the trustee in bankruptcy and a member of the Committee of inspection had been sent to the plaintiffs on the same day and accepted and cashed by them.

The defendant who was the trustee in bankruptcy raised various defences. First it was said there was no breach of covenant. This question as to whether the defendant by consenting to be adjudicated bankrupt had caused a breach of the covenant not to assign seems not to have been carried further, since under the lease bankruptcy itself was made a ground for forfeiture. The two main defences were that under the Conveyancing Acts for the space of one year the plaintiffs were deprived of the right to re-enter, and the question whether the receipt of rent created a waiver of the right to forfeiture.

The point under the Conveyancing Acts is complicated. Under section 14, subsection (1) of the Act of 1881 a right of re-entry or forfeiture under any proviso or stipulation in a lease for a breach of covenant or condition in the lease shall not be enforceable by action or otherwise until the lessor serves on the lessee a notice specifying the breach complained of and if the breach is capable of remedy requiring the lessee to remedy the breach, and in any case requiring the lessee to make compensation in money for the breach and by subsection (2) the lessee may apply to the Court for relief where an action is being brought by the lessor. Subsection (6) provides that this section does not extend to a covenant against the assigning, underletting or parting with possession of the premises, nor to the right to possession in the case of bankruptcy, but the Conveyancing Act, 1892, in section 2 subsection (2), as the Judge put it, introduces a complication for it enacts : "Subsection (6) of section 14 of the Conveyancing Act, 1881, is to apply to a condition for forfeiture on bankruptcy of the lessee or on taking execution of the lessee's interest only after the expiration of one year from the date of the bankruptcy or taking in execution, and provided the lessee's interest be not sold within such one year, but in case the lessee's interest be sold within such one year subsection (6) shall cease to apply thereto."

It was contended for the defendants that the effect of this subsection was to deprive the landlord of his right to forfeiture for the space of one year from the date of the bankruptcy, but the Court held that the effect of the legislation was as follows : "The right of entry or forfeiture or on taking in execution the lessee's interest, is fettered." That is, is made subject to the provisions contained in section 14 of the Act of 1881. "If the lessee's interest be not sold within the one year the fetter is removed at the end of the year"—that is, it can be exercised without observing the conditions in subsection (1) and (2) of the Act of 1881. "If the lessee's interest be sold within the one year the fetter is not removed but continues." In the case under consideration the lessee's interest had not been sold, and therefore the Court held that the landlord would be entitled to enforce the right of forfeiture on bankruptcy if the provision of subsection (1) and (2) of the Act had been complied with.

This finding made it necessary for the Court to consider whether those provisions had been complied with, and on behalf of the defendants it was contended that they had not, firstly, because the notice of November 13 named an unreasonably short time, 14 days, and secondly, because the notice did not require the lessee to make compensation for the breach. As regards the first point the Court held that no special circumstances had been shown in this case for an extended period, and as the notice is only intended to give the person whose interest it is intended to forfeit time to consider his position and of acting before the action is brought, the fourteen days was sufficient time. As regards the second point the Court said the point raised a curious question, as it was difficult to see what compensation for the breach could be asked in a case of bankruptcy for the breach was irremediable, yet the words of the section "in any case," seemed to imply a notice must be given whether or not the breach was capable of remedy, but the Court of Appeal in Lock *v.* Pearce (1893 2 Ch. 271) had held in general terms that the absence of a requirement for compensation does not invalidate a notice if the lessor does not require compensation, and following that decision the notice in this case would be a good one.

The only remaining point raised by the defence was whether the receipt of rent constituted a waiver of the forfeiture. The demand for rent was made with knowledge of the bankruptcy, for rent partly accrued due before the bankruptcy and in part due subsequently to it, and it had been followed by payment and acceptance. The Court held that the issue of a writ and service of a writ in an ejectme such a final election by the landlor mine the tenancy that a subsequen rent is no waiver of the forfeiture. relied upon the following cases : Carter, 15 M. and W. 718 ; Gr Moss, L.R. 7 C.P. 360 ; and Evens (1920 2 K.B. 315, *The Builder*, April and especially adopted the word Coleridge in this latter case : "There of cases which establish that if a brought for recovery of possession f of covenants in the lease that it is an election to determine the lease an subsequent acts of the plaintiff ca upon as qualifying that position."

We have recently dealt with this waiver in connection with two other c in Elliot *v.* Boynton (1923 1 Ch. 422, July 27, 1923), the Court pointed o receipt of rent after the landlord h vocally shown his intention to put an lease would not operate as a waiver. case Fullers' Theatre and Vaudeville *v.* Rofe (1923 A.C. 435, *The Builder*, 1923), the Privy Council approved t in Mathews *v.* Smallwood (1910 1 Ch "Waiver of a right of re-entry can where the lessor with knowledge of upon which his right to re-enter arises unequivocal act recognising the conti ence of the lease," and in our note t in the Privy Council we pointed ou complement to this proposition wou the receipt of rent after the landlord h vocally shown his determination to the lease would not operate as a wai right to determine the lease.

We have endeavoured to state the effect of this decision as briefly as poss illustrates the extreme complexity relating to what would appear ever dents in connection with the relat landlord and tenant.

Ancient Lights : Site Value

In our Legal Section, March 3 referred to a case Wills *v.* May, whi date was very shortly reported, and would be necessary to refer to it ag now fully reported, 1923 1 Ch. 317, an is one of importance to those possessi sites. The plaintiff owned two houses 117 and 119, adjoining each other. been purchased at public auction in 1921, and in the particulars it had be out that although the properties we site would be valuable for a factory commercial premises. The characte neighbourhood was in process of from a residential to a commercial di

It is unnecessary to go into detai nature of the obstruction which was t of the action, as it is sufficient to sa two houses were adjoining and it was the ancient lights in No. 117, the nor of the two houses, had been obstruct defendant's operation in developing fo cial purposes his site No. 115, so that t the staircase, and the larder had bee sensibly less fit for their purpose than before, but that the Court, after cons the circumstances, had considered tha not a case for a mandatory injuncti structural alterations the premises rendered as convenient as they were the cost of these alterations was a £50. But this did not dispose of the it was alleged that the obstructio light to No. 117 would damage the sit the sites of the two houses as one if for commercial purposes, and the that it had been proved that the been rendered less valuable for the buildings of a commercial character the obstruction of light.

s been held in the case Griffith *v.* Richard Sons (1912 1 Ch. 291) that damages can en for an obstruction which diminishes value, but there are some distinguishing s between that case and the one we are ring. In that case the plaintiff owned ises, but the ancient lights of *both* houses n obstructed. There was a piece of land ear of both houses and it was held that nages recoverable were not confined to preciation of the two houses alone, but ed to the whole of the plaintiff's premises red as one building site.

e was a further distinction between that d the present, as there the houses were l dilapidated, and would soon have had lemolished, whilst here No. 117 was still l condition, and likely to last several onger, and No. 119 was let on a lease bout 14 years to run, and therefore pment of the site must be delayed for eriod unless a surrender of the lease could anged.

owing the decision in Clay's case the awarded damages of £150 in all—that is, 50 mentioned above for the structural ions to No. 117 rendered necessary by struction of the light to that house as a and £100 in addition for the damage to ombined sites. But, having regard to int we have mentioned above that in this nly the light to one of the existing houses structed, and the possibility that in the of an appeal the Court of Appeal might hat the damages must be limited to the No. 117 alone, to avoid the necessity of trial the Court also assessed the damages t basis to that site alone at £50. Thus, if dgment remained undisturbed the damages o the house and the site of both houses 150, but if on appeal it was found the ge to the second site could not be taken consideration, then the damages would duced to £100.

rade Union Law : Inspection of Books.

case, Dodd *v.* Amalgamated Marine ers' Union, which we noted in our issue of mber 2, as to the right of members of a union to have expert assistance in proper where they desire to inspect the books e union, was the subject of appeal on the day that our notice of the case appeared, r is unnecessary to restate the facts as will be still within the recollection of our rs. The Court of Appeal affirmed the ion given in the Court below, and it is cessary to supplement our former note t to point out that the Court of Appeal, nsidering this case, indicated that although oint arose in connection with a trade union the Trade Union Acts, it was not limited ch matters but was of application where persons as members of companies, partners, thers claimed a right to inspect books. rrey *v.* Keep (1909 1 Ch. 561), which we red to in our former note, applying the law ade unions, was really founded upon Bevan bb (1901 2 Ch. 68), a case which turned on Partnership Act, 1890, which contains sions practically to the same effect as the Union Acts as to inspection of books. Court of Appeal referred to this case, n *v.* Webb, which also was decided by the of Appeal, and said it made the law per- clear that where a right to inspect books en the intention is that that inspection be made effective, and thus where a person der a disability not only physical, such as ness, but a disability from lack of skill perience, he is entitled to the assistance of pert agent.

is, as we pointed out in our former note, pplicant for inspection must make out a *facie* case for professional assistance, but nus then of proving that the application d not be granted on any grounds is laid the persons resisting the application.

Restriction: High Court Proceedings.

e recent decision of the Court of Appeal in . Luck (*Weekly Notes*, November 3) should red, as it deals with a point of importance gants. The plaintiff was claiming possession of a house which was let to the defendant on a monthly tenancy at a rent of £3 10s. a month, the tenancy being terminable by a month's notice on either side. The tenant had fallen into arrear with the rent, and on June 1 the plaintiff had given him due notice to quit. The defendant not having given up possession, the plaintiff on July 23 commenced proceedings in the High Court claming possession, a month's rent, and mesne profits. On the writ in this action the plaintiff, acting under the kind of summary jurisdiction conferred by Order XIV of the Rules of the Supreme Court, applied for leave to sign judgment, and this order was made by a Master and afterwards affirmed by a judge.

The defendant appealed from this order, and on the appeal two points were raised :—(1) Whether the High Court in proceedings arising out of the Rent Acts had jurisdiction, and (2) whether if it had jurisdiction the procedure provided by Order XIV was available.

As regards the first point the Court of Appeal held it was clear from section 17 sub-section (2) of the Rent Act, 1920, that exclusive jurisdiction was not conferred upon the County Court, and that an action could be brought in the High Court, but that in that action the plaintiff could recover no costs. The words of the sub-section are : "A County Court shall have jurisdiction to deal with any claim or other proceedings arising out of this Act or any of the provisions thereof notwithstanding that by reason of the amount of claim or otherwise the case would not, but for this provision, be within the jurisdiction of a County Court, and if a person takes proceedings under this Act in the High Court he shall not be entitled to recover costs." It will be observed that this subsection is more positive than some Acts relating to cases brought in superior courts which could have been brought in inferior courts for the deprivation of costs is absolute, and this makes it very important for practitioners before taking proceedings in the High Court to consider whether "the proceedings arise out of the Act or any of the provisions thereof." This point was illustrated in the case of Wolff *v.* Smith (see *The Builder*, July 20, 1923), which was a case of trespass brought in the High Court, but the plaintiff was a "statutory tenant" under the Rent Acts, and in that case it was held that as a statutory tenant could only prove his right or title under the Rent Acts the proceedings arose "out of" the Act, and no costs could be recovered. In the present case it was held that the proceedings clearly arose out of the Act, because they could only be enforced if the conditions prescribed in the Act in section 5 were fulfilled, and the Court thought it reasonable an order should be made under that section.

On the second point, as to proceeding under Order XIV, the Court of Appeal held that certainly in this case that procedure was not applicable, for no evidence had been tendered relating to those conditions, and in any case, having regard to those conditions and the provision requiring the Court to be satisfied that it was reasonable to make the order, it was very doubtful whether Order XIV could ever have application to cases under the Act.

We may notice a point mentioned by Lord Justice Bankes in his judgment. Questions of law are not argued under Order XIV, and he pointed out that a serious question of law arises in connection with the words "any rent lawfully due," in section 5 subsection (1) (*a*), as to whether they refer to rent due when the proceedings are commenced or due when the order is made. If the latter were the true construction of the words no order could be made if rent due at the date of the writ had been tendered before the order was made. In this case two months' rent had been tendered about a week after the issue of the writ. In the result, as no costs could be recovered by the plaintiff and the rent had been paid and possession had been given up, the appeal was by consent dismissed without costs.

Property Tax : Landlord and Tenant.

We may notice an interesting decision given in the House of Lords in the case Drughorn *v.* Moore (*Weekly Notes*, November 17). The respondents on this appeal were the lessors of certain premises in London and the appellant was the lessee. In 1918 negotiations had taken place between the parties for the leasing of certain stables to the appellant, and it had been proposed that the respondents should put the premises into repair and that the rent should be £85 per annum, but ultimately the appellant, the tenant, agreed to do what was required in the way of repair in consideration that no rent should be payable for the first year of the term. The premises were accordingly leased to the appellant for a term of fourteen years at a peppercorn rent for the first year, from Christmas, 1918, and thereafter at a rent of £85 per annum. Thus the first payment of rent in money would be due on Lady Day, 1920. The income tax payable under Schedule A of the Income Tax Act for the financial year ending April 5, 1920, was £23 5s., payable in two equal instalments. The appellant paid the first instalment and deducted the amount from the first quarter's rent, but the respondents returned the cheque. The appellant paid the second instalment and claimed also to deduct that from the rent, but apparently the respondents refused to accept that cheque also, for they brought this action in November, 1920, claiming three quarters' rent, but admitted that the appellant was entitled to credit in the action for the tax paid in respect of the period December 25, 1919, to April 5, 1920, that is, that portion of the period when rent in money was actually due. The contention of the appellant was that under the Income Tax Act he was entitled to deduct the tax from the rent, and the Court below had held that, as the money expended by the appellant on repairs by agreement took the place of rent, the deduction could be made; but the Court of Appeal had reversed that judgment (see *The Builder*, August 4, 1922). Rule 1 of Schedule A, No. VIII, to the Income Tax Act, 1918, provides, "A tenant occupier of any lands, tenements, hereditaments or heritages who pays the tax shall be entitled to deduct and retain in respect of the rent payable to the landlord for the time being an amount representing the rate or rates of tax in force during the period through which the said rent was accruing due for every twenty shillings thereof, the said deduction to be made out of the first payment thereafter made on account of rent."

The House of Lords held that the amount expended on repairs could not be treated as rent; the agreement between the parties was not that the tenant should pay rent in the form of repairs, but that he should do the repairs and pay no rent. It was also held that the instalments could not be treated as money paid for, and on behalf of, the respondents, and at their request, because the tenant and not the landlord was primarily liable for the payment of the tax. We may remind our readers that in the case Rossdale *v.* Fryer (1922, 2 K.B. 303, *The Builder*, November 24, 1922), where the original lessor of a house assessed for income tax at £450 net had sublet the premises at a higher rent than he himself was paying, it was held by the Court of Appeal that the subtenant could not deduct income tax on the rent paid by him, but only on the amount as based on the assessment. In that case it will be remembered that the subtenant had again underlet the premises and his under-tenants had deducted income tax from him based on the net assessment, and it was held that under Schedule A, VIII, r. 4, the sum paid by the under-tenants was equivalent to sums "actually paid" by the immediate landlord, and must be considered in the deduction he claimed to make as against his landlord.

Associateship of the R.I.B.A.

The Board of Architectural Education desire to draw attention to the following decision of H.M. Board of Education with reference to Technical Teachers' Qualifications :—Architecture.—H.M. Board of Education recognise the Associateship of the R.I.B.A. (if awarded after passing the Examinations of the Institute) as the equivalent to degrees of Universities in Great Britain and Ireland.

THE BUILDING TRADE.

YORKSHIRE EDUCATIONAL ASSOCIATION FOR THE BUILDING INDUSTRY.

AT a well-attended inaugural meeting of this Association, held in the Technical College, Bradford, on Saturday, November 17, Councillor Reeves Charlesworth, F.I.O.B., Sheffield, President of the Yorkshire Federation of Building Trades' Employers, was unanimously elected President of the Yorkshire Educational Association for the Building Industry.

In the course of his presidential address, Mr. Charlesworth said that they had met for the first time in history as a complete organisation for the purpose of encouraging and furthering building trade education—a body of building trade enthusiasts and experts, comprising technical professors, instructors, employers, employees and educational representatives. By their presence there he took it that they were all keenly desirous that the youths who wished to enter the building trade in the future should have the best instruction, on the best and most profitable lines that it was humanly possible to give them. Being elected to become the first President of such an important body, which had for its objects the better training and education of the building trade craftsmen and the closer relationship of the professors and tutors occupied in that direction, was no small honour. It had been publicly stated that to become a craftsman in the building trade only required a short training. It had been tried. Such a position of things was ridiculous and proved an utter failure. To be a craftsman of any note in the building trade involved hard work, both in study and practise. It required the guidance of eminently trained and capable tutors. It was not within his knowledge to say how many students they ought to expect in the various districts. Such knowledge was within the reach of every local authority who applied to the Secretary of their district, because their agreed rules laid it down that every firm might take on one apprentice and one to every four craftsmen in every skilled branch of the trade. The object of education in the building industry was to improve the knowledge of employers and operatives and all connected with the industry.

Mr. J. L. Manson, H.M.I., said he had been asked to sketch out, so far as it was possible for him to do so, some of the problems which the Association was likely to find. He would like to deal with the matter under the following heads :—

(1) The problem of apprenticeship in modern times was quite different from the problem of apprenticeship in days gone by. (2) Considerable changes had been taking place in the building industry, and they now needed a much more scientific treatment of their problems. (3) Improvement in the instruction given in technical schools. (4) Possibility of further co-operation of the industry.

He thought it was a fact they would all accept that there had been a very serious and marked decline in what they might call the historical or normal type of apprenticeship. It was unlikely that they would be able to return to the exact kind of apprenticeship that they used to have. Modern conditions were so different that the solution used in olden days would probably not be satisfactory now. Any solution that was satisfactory at the present time would have to be in relation to the developments that had been made in the past, and in so far as practical experience had shown them how to develop their knowledge this practical experience should be incorporated. They should realise that, apart from family and social relations, the relation between the master and the apprentice was one of the oldest personal relationships of which they knew. The main idea of technical education was the transmission of executive skill. In olden times the difficulties in transmitting that knowledge would arise, because it would not be merely mechanical skill but the accumulation of knowledge which would have to be transmitted, so that their work to-day bore a distinct relation to that work. Coming down through the ages, they could think of the period when ability to draw enabled men to transmit their ideas more readily. When printing was invented they could see the immense changes which had taken place. They could see the way in which the personal element had been lessened as soon as books were introduced, and one of the difficulties they had to face to-day was the diminution of personal contact. Coming down to manual work and the amazing specialisation which had taken place in modern industry, they saw difficulties introduced into the handling of this particular problem of the transmission of skill and knowledge in particular trades. They heard considerable talk of the evils that had arisen from the industrial organisations. He sometimes felt that they did not realise the amazing and wonderful development those organisations had given rise to. In the case of the building industry they had some peculiar conditions. The building industry had not, as yet, been greatly affected by the factory system. The builder could not produce his construction in a factory or workshop. He had to produce his construction on the site of the building. There could be no question, however, that wherever it could be done they were seeing the introduction of mass production and the increasing use of machines and large scale production. It was important from the industry's point of view that foresight should be exercised. Throughout the industry there should be that fore-knowledge and additional knowledge which was the only way in which they could be assured that there was a certain amount of elasticity in the way in which they met new situations. It was very important that they should have in view the whole range of those problems, past, present and future. In the immediate past they had to deplore that in many cases they had found the employers looked upon the question of apprentices from a business point of view. Masters had risen from the ranks and had generally themselves to thank for their success. Therefore, they looked upon the problems of the industry from the purely personal point of view, missing the fact that the industry might have problems which the individual must meet and help to solve. From the point of view of the employer, apprenticeship might not pay. There had been a certain difficulty with regard to the supply of skilled labour. The conditions and the enormous effect of the war on the building industry had undoubtedly brought them face to face with the shortage of skilled labour in a very acute form. The employees had had to form organisations for defence more than for anything else, so that these organisations dealt with wages and conditions, and not to any extent with the actual formation of skill in that particular craft.

Some of the changes wrought by the present civilisation were :—

(1) It had reduced the range of the activities of the individual worker; (2) It had reduced the apparent need for knowledge on the part of the worker. It had also enormously increased the requirements in the matter of knowledge on the part of the employer and the technical expert. The designer and manager were not taking an actual part in the construction. The non-manual designer tended to override the practical worker. The designer and manager were in one compartment and the practical worker in another. In some o other industries they had seen the enor development in the use of machinery. That tended to cover up the fact that there had a reduction in the actual skill of the wo In the building industry they saw the re of lessened skill and craftsmanship, and bemoaned the fact that it was so. One o difficulties they had to face was that, on industrial side, when a trade organis interested itself in trade instruction, there a strong tendency to limit that instru to purely trade things. He thought they w all agree that the person who was usefu life was the person who really knew a more than was actually necessary for his Even in the transmission of manual skill t was an accompanying knowledge which sh go with the training and mere manual This margin of knowledge was extremely portant in modern development. In the of the plumber they had seen the introduc of a number of new methods and mate and instead of those new materials and met continuing under the direction of the per originally responsible for them they had the developments of new trades—the hot-w engineer, &c. With the introduction of mo materials, it was important that even if worker did not enter into the design of the bu inghe should have some knowledge of the vari conditions to be watched during the erect Concrete buildings had sometimes failed bec of a lack of elementary knowledge on the pa the worker. In other industries where rese had been carried on, one of the problems w had arisen was the enormous difficulty of ap ing that knowledge because the workers obje and had not that margin of knowledge w would enable them to adapt themselves to conditions. Trade unions were anxious restrict the numbers of workers in each bra of a trade. They had the conception that could, by limiting labour to a definite fig exactly supply the demands of the industry. the building industry was so fluctuating tha was almost impossible, and there really mus a margin of skilled workers. Then there the problem of vocational selection. T could not always decide in the early st what the boy was fitted for. Their teach therefore, must not be too narrow. They n realise, particularly in the early stages, th boy might not have made up his mind at exactly what he was going to be, and in future he might be something vastly diffe from what he was aiming at at this partic stage. In the past the development of industry had not been on scientific lines. M of the operations were more or less unchan The time had now come when the build industry must be put on more scientific li The introduction of the specialist firm in duced a danger in the building industry wi he thought it was important that the indu should foresee. In the erection of a new bu ing in the past the architect had selected main contractor to undertake the main respo bility for the erection. In recent times th were so many sub-contractors that the n contractor was scarcely more responsible the work than any of the sub-contractors. was a situation which the builders ought no accept without some attempt to improve The line that he thought was sound was follows : In all those special methods of c struction they found that the architect was q ready to consult the specialist firms and mi even invite them to design that section of building with which they were concern Every architect considered himself quite capa of designing the work that the builder This could not go on, because the point ca up that modern industrial conditions had duced the expert who was not in actual cont with the construction.

The last point was that in the future t should come into closer contact with the ind

hey had in the building industry an ly interesting industry, because of its l because of the work that it undertook. hed humanity very closely. Modern ion would be quite impossible without ie and the home quite impossible without se, and we had in that sense elements of onal value which were found in such a rated form nowhere else, and on the side ical education we were coming to realise vas not merely instruction to help people their daily bread, but instruction which t the essence of real education.

meeting then appointed the various and council of the Association. The consisted of representatives of (*a*) employers, (*b*) building operatives, l authorities, (*d*) heads of technical ons, and (*e*) building teachers.

HE SURVEYORS' INSTITUTION.

Alexander Goddard, Secretary of the rs' Institution, writes as follows :—

Surveyors' Institution, as you are s one of the professional societies whose n the provisions of the draft Rating uation Bill were invited by the Minister h. The Council referred the measure ong Special Committee, representative of surveyors engaged mainly in rating it also of those who have to deal with s of local and imperial taxation in on with the management of urban al estates. This Committee, having dvantage of the Institution County organisation in order to ascertain the members in all parts of England and now engaged in considering the Bill l. In view of the fact that a certain of opposition to the Bill *in toto* appears eveloping, this Committee thought it to issue to the Council an Interim indicating that in their opinion the odied certain general principles which rthy of support by the Institution. port, a copy of which I enclose, has roved and adopted by the Council."

Report of the Special (Valuation and Rating Bill) Committee.

Special Committee appointed to con- l report to the Council upon the pro- f the Draft Rating and Valuation Bill yet concluded their detailed investiga- o and recommendations upon this but they consider it desirable to make m report in order that the Council may med as to the general conclusions arrived at. The Bill provides for such ded reforms as :

riodic revision of values throughout the and

l rates and taxes being charged on ppearing in one and the same valuation

e opinion of your Committee these principles should receive the support nstitution.

Committee's detailed recommendations endments will be directed particularly aining local valuation by local authori- while recognising that the use of the r taxation purposes of necessity involves itiative work and control by revenue that such work and control should be hin due limits such as now obtain in under the Valuation of the Metropolis 9. The proposals contained in the he establishment of a Central Valuation y for dealing with special properties ive careful consideration by the Com- nd specific recommendations in connec- rewith will be embodied in the Final

British Empire Exhibition.

nderstand that the Town-Planning will hold a conference at Wembley y 5 to May 10, 1924.

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

The seventy-first annual dinner of the Builders' Benevolent Institution was held on November 22, at the Hotel Victoria, the President, Mr. George M. Burt, F.I.O.B., presiding over a gathering of about 300, amongst whom were Major R. J. Holliday, M.C., F.I.O.B., Past-President B.B.I.; Mr. A. B. Falkner, F.I.O.B.; Capt. G. J. Aldous, M.C., F.I.O.B.; Mr. A. H. Adamson, F.I.O.B.; Mr. A. B. H. Colls, F.I.O.B.; Mr. F. Higgs, F.I.O.B.; Mr. Walter Lawrence, F.I.O.B.; Mr. Roland B. Chessum, F.I.O.B.; Mr. John T. Bolding, Mr. H. Le Marchant, Mr. F. Coleman, and Mr. J. M. Theobald, F.S.I.

Mr. A. H. Adamson, F.I.O.B., in proposing "The Builders' Benevolent Institution and its President," explained that the Institution was founded seventy-five years ago for the purpose of granting relief to necessitous builders over fifty-five years of age who had carried on business for ten consecutive years within a twelve-mile radius of Charing Cross. At the present moment there were fifty men and women pensioners. For the past three years the Committee had been able to supplement the pensions by a gift at Christmas of £5, and for the last year they had been able to make a similar gift at midsummer as a contribution towards the increased cost of living. He thought they would agree with him that the Institution deserved all the support that could be given to it. The Institution received support from all interested in the building industry, but sometimes wondered whether employers could not do something more in supporting the Institution, not so much in a direct way but indirectly. By that he meant they might all do what they could to prevent so many employers falling by the way. He thought the Institute of Builders had made a move in the right direction, because in their syllabus of the examinations which would in future be held for Licentiate and Associate members of the Institute they had made accountancy and costing one of the compulsory subjects, and if employers generally took more notice of accountancy and costing there would not be so many failures in the industry. He thought the members might help their fellow builders in trying to see if there was not some means by which the vast amount of labour which was thrown away in tendering could not be improved upon. The conditions in the industry at the moment were disquieting, much more so than before the war. The spectacle of a number of firms tendering for a job was wrong altogether. He had been going through his own tender book and had noticed one or two glaring instances of what he called absolute waste of labour. In one job to the value of £5,000 there were twenty builders invited to tender, and in another of £2,500 eighteen were invited to do so. That meant that a great deal of money was wasted by employers in tendering for jobs which there was no possibility of ever getting. If builders were asked to supply information as to the number of jobs they had tendered for and the number they got the probability would be that they would find they only got one job out of twenty. This was the result of fierce competition, and he hoped that one of these days the builders in conjunction with the architects and surveyors would find a more reasonable way of getting tenders for jobs than that which existed at the present time. As long as those conditions prevailed, it was up to everyone to do what they could to help their brother builders who met misfortune. He could not imagine some of the other industries in the country working on such a narrow margin of profit as the builders.

The President, in reply, said he desired to thank everyone present and all the subscribers for the help that they had given. He had hoped that they might have been able to collect as much as had been done in previous years, but unfortunately times were bad; he was roughly about £300 short of what the total was last year.

Mr. A. H. B. Colls, in proposing "The Allied Trades," said the prosperity of the allied trades depended upon the prosperity of the building trade. He felt sure he was voicing the feelings of his fellow builders that the success of a large job depended very considerably on the co-operation and goodwill of the sub-contractor to the builder.

Mr. H. Le Marchant responded.

Mr. A. B. Falkner, in proposing the toast of "The Vice-Presidents, Trustees, Committee and Stewards," said he was sure that the Committee had derived a great deal of satisfaction and pleasure from the realisation that they have brought a certain amount of brightness into the sad lives of their less fortunate brothers in relieving their necessities and endeavouring to smooth out their battles during their declining years. He coupled the toast with the name of a veteran, Mr. John T. Bolding, than whom he could safely say no one had longer or better served the Institution; he had been engaged in this work for 53 years.

Mr. John T. Bolding, in responding, said the large sum that had been collected during the last three or four years had been collected through the energy of the Presidents, and if the President instead of going back four years had gone back fourteen he would have had a large amount beyond the average.

Capt. G. J. Aldous proposed the toast of "Our Visitors." He said to the architects he would offer a special welcome, for it was always a pleasure to meet them at these functions and to get to know them in a more personal manner than it was possible in the average business acquaintance. It was by the closest possible co-operation between architects and builders that the best results were achieved in connection with any building contract. The quantity surveyors were with us to-night, in his opinion, the builders' best friends. By the excellence of their quantities, the clearness of their descriptions, they had saved many hours of labour in the preparation of estimates.

Mr. F. Coleman, in responding, said he was pleased to notice that the building trade kept a stiff upper lip during times of stress. He admired that spirit very much, and he thought that everyone who fought through periods of depression the same as the building trade did would get their reward.

At the close of the proceedings the President stated that after the collection during the evening he was still short of £73 15s. He would have liked to have got the extra money, but he must admit they had all been very good to him. The total amount which had been collected was £1,898 15s. 6d., about £102 less than was collected last year.

British Museum Lectures.

These lectures continue to open out interesting points in regard to ancient civilisations, both as regards methods of building and customs of the people. The Egyptians had a regard for planting trees, though lacking the advantage of any soil in which to plant them. At the Senusert Pyramid pits were found outside the walls. These curious round pits, coming at regular intervals, could not be explained, but it is now supposed they were filled with soil and that trees were planted in them. The rock tombs of Egypt are a remarkable example of the traditions of building being continued though the conditions required no such structural forms. They cut rafters on the face of the roof out of the solid rock, and columns were hewn out of the solid mass of the rock they were excavating in the same manner as if they were building. The temple of the Sphinx had wells inside it, in which were found statues in Diante and green basalt; this Sphinx dating probably from during, or after, the fourth dynasty. In the back of the Sphinx itself is a grave, and as no burials took place in that region after the period of the great Pyramid of Khufu, the Sphinx must date from after that time. It is cut out from the solid rock, its natural form having probably first suggested the form of a Sphinx, and so they carved it into one. Its face is believed to have been originally painted red.

PUBLIC WORKS CONGRESS.

As in previous years, a Congress was held this week in connection with the Public Works, Roads, and Transport Exhibition at the Royal Agricultural Hall, London (a review of the Exhibition is given on p. 858), and a large number of papers were read dealing with subjects of interest to local authorities.

The Road Beautiful.

In the course of an address entitled "The Road Beautiful," MR. J. L. REDFERN, A.R.I.B.A., Borough Engineer and Surveyor of Gillingham, said proper regard for proportion, a careful selection of materials, and attention to details, whether in the design of a bridge, a building, or a road, would produce a result that would merit the appreciation of those who had to use them, and redound to the credit of the designer. Good environment played an important part in the formation of good character. The house and its neighbourhood which possessed any elements of beauty helped in that way, and now that folk in their leisure had betaken to the highways, roads also should contribute to that desirable end.

It could not be gainsaid that the roads of this country were being adapted to meet their main purpose, and the development of road-making during the past dozen years had proved that British engineers were second to none in their ability to devise roads strong enough to bear any accession of traffic, and spacious enough to satisfy the most progressive; yet one sometimes saw roads strong enough to carry their burden but with some fault, it might be of design, setting out, or finish, which displeased the eye.

If a road were intended to be straight, the kerb should be laid straight in fact. Whatever pleasure a kinked or wobbled kerb gave to him who made it so, it gave none to the beholder. Where the road wound they should find curves set out with the utmost care, so that the eye swept them without offence. A carriageway which changed its width seldom looked so well as one in which the kerbs ran parallel. If there must be irregularity in road boundaries, the variations might with advantage be thrown into the footpaths. The cross-fall in a footpath, and the contour of a carriageway, should be regular to satisfy the eye, and crossings and intersections required skill in setting out, if the good form of a road were to be maintained. In the longitudinal grading of new roads, straight lines or gradual curves should be obtained, and kinks and sharp angles avoided. If a new road could, by a slight alteration to its axis, be aligned to a church tower, a clump of trees, a shrubbery, or a distant hill, the vista obtained added a charm to it. The size and position of gullies, the design and position of lamp-posts, tramway standards, ventilating shafts, water columns, or other necessary obstructions, demanded a good deal of thought.

Where a new road had been constructed in a cutting, the new boundary should be studied. One occasionally saw a clumsy retaining wall which might have been made beautiful with a little consideration, or an earth bank which could have been graded better and finished off with turfs. Walls, fences, and railings which defined road boundaries, if carefully designed, contributed to appearance. In urban roads good effects could be obtained with pavings. Paving slabs and paving bricks could be laid in many different ways. Most old country roads possessed a fine setting with their grass margins, bordering hedges, and stately trees. Some of them had been widened, and in certain cases where the sheltering hedges had been sacrificed a new view of the country was revealed. If the disclosed view were not impressive a new hedge should be planted, and where old trees had had to be sacrificed new trees should be planted, either on the path or near it, and an occasional seat provided to afford rest and shade to wayfarers. In urban districts judicious tree planting added materially to the amenity of the roads.

Was it not high time that telegraph and telephone wires were in underground conduits, and the wearying and irritating telegraph poles banished from the highways? A good tree should be planted to mark the spot where a pole once stood.

Tarring of country roads had become a fairly general practice, and although black was a very restful colour for the sight, one hoped that some day waterproofed surfaces might be finished in tints at once restful to the eyes and gratifying to the colour sense. Colour effects could be obtained in paved streets, and there a contrast should be arranged between the carriageway and the footpath. In some towns one had observed the kerb and pavement of pink-tinted natural or artificial stone or brick and the carriageway of grey stone, a pleasing combination. In every case it was very important that there should be a sharp definition of colour where the carriageway and footway met. If luminous kerbs could be produced they would be of great assistance to pedestrians and motorists, for they would glimmer in the night. Certain stones when used as kerbs tended to show white at night. Whitewashing kerbs was practised in some districts.

Footpaths on country roads were not receiving the attention they cried aloud for in these days. Many of them were utterly neglected. So long as the carriageway had a better surface than the footpath pedestrians would choose the road, and accidents would occur. There was room for great improvement in footpaths throughout the land, and a lot of useful work might be provided for the unemployed in putting them in order.

There had been a vast improvement in road signs, but neither signs, signals, nor numbers were large enough to be legible to those motoring at the average speed. Place names should be set up in bold type at each end of villages and hamlets for the information of road users, and all road signs which were not lamplit should be painted with a luminous paint so as to be visible on dark nights. The selection of the right colour for painting posts, standards, shafts, columns, and fences deserved careful consideration.

Road Reconstruction.

MR. W. P. ROBINSON, A.M.Inst.C.E., County Surveyor of Surrey, in a paper entitled "Reconstruction of Foundations of, and Carpets on, Existing Roads," said in one case he had recently entirely reconstructed and widened a main road carriageway with a cement concrete surface. The old road varied in width from 13 ft. to 20 ft., with a surface-tarred water-bound macadam crust, whilst the new carriageway was 30 ft. wide, and the sub-crust and surface was entirely of Portland cement concrete 8 in. thick. In places the new surface had to be laid in half-widths in order to keep the road open for traffic. No foundation was provided other than the shaping of the ground to a camber of 1 in 50, but the subsoil was of loamy sand which was well rolled before placing the concrete, which was placed in two coats simultaneously, the lower one being 6 in. thick of 4 parts gravel, 2 parts sand, and 1 part cement, and the upper or surface layer being 2 in. thick of 4 parts gravel, 2 parts sand, and 1½ parts cement.

The concrete was laid in alternate bays not more than 35 ft. long by 20 ft. wide, and the reinforcement was generally 10 lb. per square yard, but the weight was varied according to the stability of the subsoil. The joints between bays were laid at an angle of 60 degrees to the kerb line, and the reinforcement was laid parallel to and at right angles to the joints, which were vertical butt joints afterwards filled with hot bitumen. Two mixing machines were employed, one for t course concrete and one for the upp so that the concrete could be lai course and operations on any one tinued without cessation until that finished. The concrete, after levelli the finished surface, was immediatel with waterproof covers for about s when the covers were removed and face of the concrete brushed with sti to remove all surplus scum, and th was immediately covered with 3 in sand, which was not removed for Particular attention was given to th of water used, and he considered that of the most important points to watch to eliminate cracks. The correct p of water to give maximum strengt concrete necessitated much more l ramming the concrete than had been on some concrete roads. Cubes 6 i dimensions made from concrete tak the mixing machines and actually use road withstood on test a crushing 78 tons, or an average load of 4,87 sq. in., at 28 days; the cubes, howev not reinforced in any way.

Before any surface dressing was a the concrete, traffic was permitted t for some weeks, so that any loose m the surface might be disintegrated a off. When the surface showed a smoo mosaic appearance, he preferred to dressing of waterproofing material, a experimenting with various substance that good results were obtainable b first a dressing of tar-oils, followed l hot or cold bitumen, which would adhe than if applied direct to the concrete.

The concrete carriageway referred t was 1½ miles in length and 30 ft. w not yet shown any cracks, nor had th been chipped or affected in any way, the road had been used almost daily months by a 14-ton traction engine three trucks of gravel to the work. face was absolutely free from corruga camber was 1 in 50, and curves of radius had been given a maximun elevation of 7 in. from kerb to kerb were of pre-cast concrete in 3 ft. leng which might be set back when a wid the carriageway became necessary adopted a concrete surface for the carriageway of the new arterial ro miles) which were about to be constr the county of Surrey, as he was satis an 8 in. layer of reinforced concrete perly laid and cured, would give satisfaction to the users of the road more economical in the end than a adam or bituminous carpet on a found hardcore or pitched stone.

Mains in Public Highways.

"The Position of Mains in Publi ways" was the title of a paper read STEPHEN LACEY, B.Sc., Assoc.M.In Distributing Engineer to the Gas Li Coke Company, who said, in connect the question of the position that main occupy in public highways, there w chief points of view to be considered. first place it was obvious that mains be laid in positions which would ne the least possible disturbance of the ro when the main was originally laid o quently. In the second place, attenti be paid by the undertaking owning th to the relative costs incurred by the of alternative positions. It would g be found that the two points of view conclusions which were not in confl one another.

In any distributing system, whether gas, or electricity, there were, in gene classes of mains. There were trunk c mains which were not connected d consumers' houses; and there were the mains, fed by the trunk mains, from w consumers were directly supplied. generally agreed that one service mai be laid in each footway of roads ir

ts, where the number of service con- is were relatively numerous and where olume of traffic necessitated the laying high-class paving in the carriageways. eason for that was that with a main in footway the lengths of the services were d to a minimum, and new connections pairs to mains could be made without ing the carriageway. It was impractic- lay down a hard-and-fast rule defining cumstances which warranted the laying licate mains; each case must be con- on its merits. The provisional rule opted in setting out the distributing s for housing estates developed since r had been to lay single mains in sub- roads where the width of the carriage- as about 25 ft. or less, and to lay close kerb line in one of the footways, the ing that if, in the future, a change in ons should make it desirable to lay a main, both mains and all the service would then lie clear of the carriage- When single gas mains were laid in otway to supply customers on both f the road they had to be laid at a depth than usual, because service onveying gas had to be laid with a fall main in order to provide for the collec- d removal of water condensed from the

horoughfares with wide footways it be practicable to lay trunk mains as smaller mains in the footways, but the footways were not wide enough to re than accommodate all the service and cables. But there was less objec- laying trunk mains under carriage- han the service mains, for the reason no service pipes were connected to hey were not often opened up after once been laid.

depth at which mains were normally ow the surface of the road depended to xtent upon what they carried. Water had to be laid at such a depth as to be reach of frost; three feet was con- the minimum safe depth. The depth h gas mains were laid was not limited way, and it was usual to lay at about in. under carriageways and at 2 ft. footways. It would appear reasonable me that the greater the depth at which was laid the less the risk of damage ration or other causes. But that as- on was not borne out by experience. lidity and uniformity of the bed on the pipes lay were the factors that had atest influence in establishing and main- conditions which ensured the stability mains under the stresses due to vibra- c., and in his experience the depth at the main was laid had proved to be of ry importance.

construction of subways had often been ed as a remedy for the opening up of or alterations and additions to mains; ey could only be economically built special conditions. An examination of sting subways showed that they had lly all been built in new roads such as ctoria Embankment, Holborn Viaduct. ngsway, which had formed part of great ruction schemes in areas already highly ed. Schemes to build subways in exist- ds already congested with mains would not only the cost of building the sub- t the cost of diverting the existing That would certainly prove to be pro- .

ust be borne in mind when discussing stion of the position of mains in public ys that the distributing systems of nd gas undertakings in particular had n laid down in the last few years, but a great extent heritages from the past could only be slowly and laboriously d to conform to present-day require- The settled policy of all progressive kings owning mains under public hfares was to take every opportunity by the re-paving works of road autho- rities to overhaul and modernise their plant. New mains were then laid in the footways where possible and superfluous mains and service pipes under the carriageways thrown out of use. The importance of ensuring that that work should be carried out thoroughly and expeditiously was becoming more and more generally recognised. That being so, the cordial co-operation of road authorities and the undertakings, which was essential to successful working, followed as a matter of course.

Bridge Construction.

In the course of a paper entitled "General Construction of Bridges," presented by Lieut.-Colonel J. F. Hawkins, O.B.E., M.Inst.C.E., County Surveyor of Berkshire, and Captain C. G. Mitchell, A.C.G.I., B.Sc., Ministry of Transport, it was stated that in the last few years the number of mechanically-propelled vehicles had increased very rapidly, and the unit loads carried by them were much heavier than was contemplated even a few years ago. It was noticeable, too, that the average speed of these heavy vehicles was much greater than formerly, probably due to improved road surfaces. This revolution in traffic conditions had found a very large number of bridges to be quite inadequate as regards strength and width, and in the past two or three years very extensive schemes of bridge reconstruction had been put in hand. The improvement in roads generally preceded the improvement in bridges, and for this reason there were still a very large number of bridges not fit for present-day loading, and these provided a serious problem for the highway engineer.

During the last two or three years the Ministry of Transport had assisted to a certain extent in determining a minimum standard of loading. Previously every engineer had his own load for use in designing bridges, and it was obvious that that practice had great disadvantages. The standard load of the Roads Department, Ministry of Transport, was based on a 20-ton engine drawing three 13-ton trailers, with 50 per cent. added for impact. It was thought that that loading would provide for all normal traffic conditions for very many years to come. The 50 per cent. allowance for impact had given rise to a certain amount of criticism, and it was reasonable to argue that that impact allowance should be made to vary with the span. Impact on a road bridge was extremely difficult to determine owing to the very large number of variables. The condition of road surface, material of road surface and foundation, speed of vehicle, tyres, sprung and unsprung weight of vehicle, type of bridge and material of which the bridge was constructed, are some of the variables even when the span of the bridge is constant. Of these variables the condition of the road surface was not the least important, and it was essential to safeguard our bridges that particular attention should be given to this point. If a rational expression for impact on highway bridges could be determined and demonstrated there was no doubt that it would find general acceptance.

One effect of the standard load had been to eliminate, for all practical purposes, the type of bridge having two main girders with the deck supported on cross girders, except where very long spans were involved. That was, no doubt, due to the requirement that standard trains should be placed on the bridge side by side, one train for every 10 ft. width of carriageway. As an extreme example a road bridge having a 40 ft. carriageway and two 10 ft. footways would necessitate a live load of 88 tons being carried on one cross girder 60 ft. long.

Sir Henry Maybury, in summing up the discussion, impressed on those engaged in road work the importance of getting good value for money, and of planning on economical but sound lines. A calculation made in connection with the classified roads of the country showed that if it were possible to save in road works 1d. per superficial yard it would represent £1,800,000 a year.

Private Roads.

Mr. Edward Willis, Borough Engineer and Surveyor, Chiswick, in an address on "Estate Road and Private Street Construction and Standardisation," said the subject of town planning was intimately connected with private street and sewerage work, and therefore the designer of estate roads should have a knowledge of the foundation work of town planning; he should also have sufficient vision to anticipate the future of the area for which he was called upon to design the estate roads, and he should also bear in mind whether such roads were likely to be dedicated to the public use in the future, or be mainly retained as private roads.

Under the Town-Planning Act Regulations, the Ministry of Health quite recognised that the old fixed minimum width of 36 ft. or 40 ft. usually prescribed in by-laws, with greater widths of 50 ft. and 60 ft. under special circumstances, were not desirable under all conditions where new estates were being laid out, and a much better effect could often be obtained by the provision of *culs de sac* of narrow widths, roads with turning places, wider paths, grass margins, squares, and similar variations of the ordinary by-law road.

It would, therefore, appear desirable briefly to set forth a few suggestions as to roads which might be suitable for the ordinary building estate.

(1) Where reasonably straight or curved roads were desirable as main thoroughfares following the contours of the land, the houses adjoining such roads should not be brought out to the boundary of the road, but should be set back to building lines not less than 120 or more than 200 ft. apart, excluding any architectural ornaments, such as porches, bay windows, etc.

(2) Where roads were never likely to be subject to main through or cross traffic, the ordinary by-law width of 36 ft. to 40 ft. should be ample as the initial highway width, but since only the future could determine what might become an inter-communication road, he strongly advocated building lines set back about 20 ft., or more, giving a minimum width between buildings of 80 ft. Probably the by-law road usually specified with footways each one-fifth or one-sixth of the total width of highway would be the most convenient for traffic, both vehicular and pedestrian.

(3) Where roads could not be usefully adopted for even local traffic, then *culs-de-sac*, squares, or other similar methods might be adopted with carriageways of limited width, but with the provision of places for turning. It would, however, be undesirable to accept a total width of highway below, say, 24 ft., if a carriageway and footways were to be constructed, even in such short roads as a general rule, and he would emphasise the desirability of building lines being set back to provide 80 ft. between dwellings when possible.

(4) The 16, 14, or 13-ft. carriageways recently adopted for continuous roads in the lay-out of various housing schemes were not wholly desirable, but the two-vehicle standard is a *sine qua non* for all roads exceeding 150 ft. in length, and the least unit vehicle widths he had consistently advocated were—(*a*) 8 ft., for the lightest class of road (local); (*b*) 9 ft., for the intermediate class of road (Class 2); (*c*) 10 ft., for the main arterial roads (Class 1).

(5) In the lay-out of an estate not only should the contours have an important bearing upon reduced gradients, ease of traffic, sewer routes, etc., but careful design generally should lead to effective harmony with adjoining estates, and with slight deviations good aspects and vistas might be worked into the general plan.

PUBLIC WORKS EXHIBITION.

THE Public Works, Roads, and Transport Exhibition, held at the Agricultural Hall from November 19 to 26, formed a comprehensive collection of the machinery and materials used in modern road construction.

A selection of samples of their road surfacing materials was shown by the Limmer & Trinidad Lake Asphalt Co., Ltd. (34, Victoria-street, S.W.1), including Trinidad Lake bitumen, Trinidad asphalt-macadam, "Lithocrete" on Trinidad asphaltic concrete, compressible rock asphalt, "Lithofalt" paving blocks, and "Lithocrete" paving, Hutchinson's testing apparatus and instruments for standardising bituminous road materials, &c., and mastic asphalt as applied to modern buildings, were also shown.

Messrs. Tuke & Bell, Ltd. (27, Lincoln's Inn Fields, W.C. 2), exhibited a 5-ton 6-wheel lorry, fitted with "Constable" patent gravity hand-operated end-tipping gear and patent automatic tail-door; a 1-ton capacity lorry, with end-tipping body with patent gravity hand-operated end-tipping gear, on 1-ton chassis; a "Carlton" revolving sewage distributor; and "Grip" patent manhole-cover and frame, for heavy road traffic.

The exhibits of the Ingersoll-Rand Co., Ltd. (165, Queen Victoria-street, E.C. 4), consisted of air compressors, "Leyner" sharpeners, oil furnaces for forge shops, used in conjunction with "Leyner" sharpeners; samples of shanks and bits and set hammer samples, made up on "Leyner" sharpeners; "Jack-hammers," and numerous other devices.

Messrs. Stothert & Pitt, Ltd. (Orchard-street, S.W. 1), exhibited one of their No. 16 size combined stone drying and mixing plants. The machine is fitted with separate drying and mixing drums, and designed for giving under normal conditions an output of 60–80 tons per day. The drying drum is of the "Victoria" type, the mixing drum being of the tilting type. The combined plant is of the portable type, fitted with end loading device for feeding from ground level. The firm also exhibited one of their latest pattern tilting "Victoria" concrete mixers of 5 cu. ft. mixed batch capacity. This machine is fitted with elevating loading hopper, water tank, and driven by a petrol engine.

The stand of the Ransome Machinery Co., (1920), Ltd. (14–16, Grosvenor-gardens, S.W.1), exhibited (1) Batch type combined tar macadam dryer and mixer with double drying drum and fitted with pump for the binder, with an output of 2¼ in. tar-macadam at the rate of 6 tons per hour. This plant is made in three portable or stationary sizes, with outputs of 4, 6 and 12 tons per hour; and in two stationary sizes, with outputs of 20 and 30 tons per hour. (2) A light-weight tilting drum concrete mixer with barrow hoist, mounted on two large wheels to enable it to be run about by two men. This machine is self-contained with 7 cu. ft. elevating skip, water tank and 3 h.p. petrol engine, and turns out 40 mixed batches of 5 cu. ft. per hour. (3) A new block-making machine was also shown, with three moulding boxes mounted on a low revolving frame. While the first mould is loaded, the second is pressed, and the finished product in the third box is taken away. The machine will make solid or hollow, plain or ornamental blocks, bricks, slabs, copings, angles, &c., in innumerable shapes and any dimension within 18 in. by 9 in. by 9 in. Hoisting winches, steel sheet piling, concrete pile helmets, and steel hand carts were also shown on this stand.

Messrs. Ruston & Hornsby, Ltd. (Lincoln), exhibited a No. 6 crane navvy, mounted on caterpillar tracks. This machine has a cutting pressure on teeth of 6 tons, and a bucket capacity of 7–8 cub. yds. It is fitted with three sets of engines—the main engine operating the hoisting and travelling motions: racking engines; and slewing engines. The boiler is designed for 125 lb. per sq. in. The caterpillar tracks have cast steel track pads and are specially designed for standing up to hard usage. There are three operating levers and one foot pedal only, thus making it possible for one man to work the machine on light and medium outputs. An 8-ton tandem motor roller, a cold starting oil engine (42 b.h.p.), pumping plant, a 9½ b.h.p. portable petrol-paraffin engine, a centrifugal pump, and a helical centrifugal pump were also shown by this firm.

The Walker-Weston Co., Ltd. (Empire House, 7, Wormwood-street, E.C. 2), exhibited samples and models of their system of interlocked double-layer reinforcement. This system originated at the Port of London Authority in 1917, and was used by the Port of London Authority in the construction of King George V and Victoria Docks, for concrete surface work, including roads, quay-ways, floors, &c. The exhibits included a model of a reinforced concrete road, showing location of reinforcement in the concrete, and some illustrations and drawings of method of interlocking concrete joints. In addition, a film showing construction of Manchester concrete roads and the Dartford-Erith road, Kent, laid on the "Walker-Weston" system, was exhibited.

Messrs. Builders & Contractors Plant, Ltd. (51, Tothill-street, S.W. 1), made a special feature of the B.C.P. combined stone dryer and mixer, of a small portable size, fitted with an oil burner. This machine was specially designed for small road repair jobs. A petrol road roller, a petro flame heater for patching, a new road gritting machine of a small size suitable for gritting tarred roads or for rendering the surface of a wet road less slippery, the "Roll" concrete mixer, two-wheel tipping carts, a tar sprayer with a new patent steam driven pump, a complete working model of crushing and screening plant together with an elevator, and tar and bitumen boilers were also shown.

Messrs. Millar's Timber & Trading Co., Ltd. (Pinners' Hall, E.C. 2), showed the following machines in operation under their own power: (1) "Cummer" asphalt plants and accessories, which are supplied in either portable or stationary units for outputs of approximately 8, 12, 18, 20 tons of bituminous sand carpet per hour; or 800, 1,200, 1,800 2,000 sq. yds. 2 in. sand carpet per day. (2) "Jaeger" mixers, equipped with automatic tipping water tank, automatic loader, and hoisting drum. (3) Tandem steam road rollers, with a low centre of gravity, supplied in eight sizes, 2 to 10 tons in weight. (4) Steam shovels, with separate engines for hoisting, slewing and crowding. (5) The "Tructractor" motor truck, with tip body of 24 to 30 cub. ft. capacity, for handling road material. Portable pumps, wagon loaders, large melting tanks, air compressors, rock crushers, &c., were also exhibited on this stand.

Mr. Frederick Parker (Viaduct Works, Catherine-street, Leicester), exhibited (1) A multiple stone drying plant of the two-tube type, capable of dealing with upwards to 100 tons per day, complete with hot air exhaust fan, furnace, &c. (2) Asphalt and tar-macadam trough mixer, of two-thirds cub. yd. capacity per batch for dealing with small material for surface or carpet work. (3) A concrete mixer, of 7 cub. ft. capacity per batch of unmixed material, complete with loading hopper, automatic water tank, and power unit for driving. (4) A concrete mixer, of 4 cub. ft. capacity per batch, combined with a 2-h.p. petrol engine. (5) A 16 in. by 9 in. solid body type stone breaker and ore crusher, with an output approximately of 8–11 tons per hour. (6) A 12 in. by 4 in. solid body type granulator, capable of dealing with 2½ to 3½ tons per hour down to ¾ in. material.

Messrs. Richard Hill & Co., Ltd. (Middlesbrough), exhibited samples of "Maxweld" electrically welded steel fabric in varying strengths and spacings. A sample of double layer fabric, designed to provide for flexure, contra-flexure and shear stresses, which are with when slabs are constructed over mad or unstable ground, was shown. This firm exhibited a new product in the shape of trically welded fabric made from mild steel to British Standard specification. The rods taken from the rolling mills and without further process are manufactured into fabr

Messrs. Drummond Bros., Ltd. (Rydes Guildford), exhibited a selection of "Willing Worker" plant. The "Wi Worker" concrete mixer is a portable b mixer, with a capacity of 3 to 6 cub. yds. hour, driven by 3 b.h.p. paraffin engine, arranged in a steel trolley. The "Wi Worker" diaphragm pump is driven b 3 b.h.p. paraffin engine, and arranged complete outfit on a steel transport tro Its capacity is 5,000 gallons per hour. "Wi Worker" duplex force pumps and drag outfits were also shown.

The outstanding feature of the stand Messrs. Winget, Ltd. (24, Grosvenor-gard S.W.1), was a quarter-size model of the "Wo Plant" for the automatic production of macadam. This is a new stone-drying tarring plant which takes the crushed stone dries it, frees it from dust, dips it in t bitumen, and finally loads it into a railway tr practically without any handling by man la from start to finish. The plant is capabl producing 100 tons per eight-hour day. Pra ally all the exhibits on this stand were at work. They included a pressure mac for manufacturing concrete blocks and s a portable engine-driven crusher, mixers suit for wet or semi-wet concrete, and also, by addition of special blades, tarred or bitumi products. A new portable conveyor was shown.

Messrs. Johnson's Reinforced Conc Engineering Co., Ltd. (Manchester), special attention to their new pattern steel lattice reinforcement, as used for concrete ro culverts, tanks, floors, roofs, walls and sim construction, for which is claimed rigi without interference with the quality or tinuity of the main tension wires. "Keed fitments, used in conjunction with ordi round mild steel bars for concrete be columns, &c., were shown, and also "Brickt reinforcement for brickwork, partition s concrete blockwork, &c., where extra stre and lightness of construction are required.

Granite macadam from their various quar kerb, channel, setts, &c., granite for a tectural, monumental, dock, harbour engineering work, slag (tarred and untar "Silex" brand Yorkstone for pavings, "non-slip" stone footway paving, arti stone, &c., were exhibited by Messrs. Broo Ltd., of 65, Victoria-street, S.W.1.

The exhibit of the British Reinforced crete Engineering Co., Ltd. (1, Dicker street, Manchester), consisted of a large nu of photographic enlargements illustrating work in which B.R.C. fabric has been The exhibit also included a roll of B.R.C. f and a concrete slab showing the position o fabric in the road.

Messrs. C. A. Peters, Ltd. (Stores-road, De showed their "Carbolineum" wood pr vative, "Peteroid" cement special "Peteroid" coloured cements, "Peter special cements, "Peteroid" stucco and terr grains, sands, &c., "Peteroid" waterpro powder, and "Peteroid" fluoric crystal hardening old floors and all lime or con work.

The Phœnix Engineering Co., Ltd. (Ph Works, Chard), exhibited a bitumen h with a capacity of 320 gallons; a contin heating road tar spraying machine of 160 ga capacity; a pot-hole repairing outfit; a f gate hand lift contractors' trench pump; a hand lift contractors' diaphragm pump.

The exhibit of The Expanded Metal Co., (York Mansion, Petty France, Westmin London, S.W.1), consisted of samples of company's various products; a model sc of kerbing and road; photographs of muni works carried out on its systems; "Expan

rcement for roads; expanded steel sheet rcement; lathings for plasterwork, and net" reinforcement for brickwork, con- blockwork, &c.

ssrs. Ferodo, Ltd. (Sovereign Works, el-en-le-Frith), exhibited models showing odo" fibre and bonded asbestos fitted to is types of brakes and clutches, and nens that had been in use for long periods, ng the resistance to wear. Further its were samples and models of "Ferodo" t stair treads, and "Feroleum" fibrous ng.

large assortment of road materials and ng materials, including granite setts, slag, bricks, pipes, roofing tiles and slates, was exhibited on the stand of Messrs. t Matthews & Co., of West Africa House, sway, W.C.2.

e Helical Bar & Engineering Co., Ltd. 4, Victoria-street, S.W.1) exhibited Cher- quartzite of various sizes for macadam chippings for road surface binding and eting purposes, spalls for breaking, mac- , chippings, helical bars for ferro-concrete with a continuous mechanical bond to de security against slipping were shown, also mild steel round bars, all diameters h to 1½ in. with lengths up to 40 ft., and ven wire concrete reinforcement.

ssrs. William Shepherd & Sons, Ltd. stone, Rochdale), exhibited samples of ltic slag for roads, samples of asphaltic tone for playgrounds, footways, carriage s, hard tennis courts, floors, yards, and al surfacing work; lump slag for pitching foundations; broken slag, adhesive com- on for cementing wood block and boarded , and tramway parging blocks.

e exhibit of Messrs. Tangyes, Ltd. (Cornwall s, Birmingham), included a 25 b.h.p. -oil engine, cold-starting type, suitable for ith residual oils, fuel oils, refined oils, or ed to use tar oils, alcohol, &c.; a three- vertical treble ram pump, four types of n-Gyro" centrifugal pumps, and one of atest pattern single ram pumps, lifting e, &c., were also exhibited.

IE LONDON ASSOCIATION OF BUILDERS' OREMEN AND CLERKS OF WORKS.

IE London Association of Builders' Fore- and Clerks of Works held their annual er at the Holborn Restaurant, Kingsway, November 24, under the chairmanship of G. C. Hans Hamilton.

fter the loyal toasts had been duly oured, the CHAIRMAN proposed "The Lon- Association of Builders' Foremen and ks of Works," and said he had to apolo- on behalf of Sir G. C. Hamilton, , owing to the present political contest, been prevented from taking the chair. London Association of Builders' Foremen Clerks of Works was too well known for to go into unnecessary details, but the sec- ry had given him certain very impressive s. It was founded in 1894, and its objects e the promotion of friendly and social in- ourse by means of frequent meetings; to st members when in want of employment, provide pensions; to provide an in- ance fund against death; to provide an mployment benefit fund; to assist mem- s financially by grants from the funds. pensions fund asked for special assist- e: it paid out a sum of £420 yearly. The nbers of the Association were the lieuten- s and non-commissioned officers of the lding world. Not only was it their duty instruct the men under them, it was often essary for them to instruct the men above m. The principal object of their presence t night was to make the Association a success. Hard times made it difficult to subscribe as one would wish, but he made an urgent appeal that the guests would subscribe in order to make the dinner of the London Association a great success.

In response, the PRESIDENT of the Association said it was a very great pleasure for him to reply to the toast. He thanked all who had come to their assistance in the difficulties they had found themselves a few days back. The chairman had spoken of the principal aims and objects of the Association; but he would emphasise the benefit which accrued to members of their industry by joining an Association such as theirs. A general foreman, or clerk of works, had all to gain by becoming a member, as they catered for the educational side, in addition to the social side. This was only accomplished by giving lectures, visits to works of interest, and discussions on trade matters generally. In this direction their secretary had been very energetic, and had allowed very few opportunities to slip by him which might advance the knowledge of their members. It was his ambition to induce any architect, or professional man, who could be interested in their Association occasionally to read them a paper on a subject of general interest; and he felt sure he would be only too pleased to make arrangements for the success of such an object.

MR. F. SANDERSON proposed "The Building Trade," and said it was one of the oldest in the world, and had very great responsibilities in the country.

MAJOR RICE, in reply, said no doubt better times were in store for the industry, but they did not know how long that would be.

Other toasts included "The Architects and Surveyors," proposed by MAJOR A. VIGOR, and responded to by MAJOR N. OLIVER; "The Visitors," proposed by the VICE-PRESIDENT, and responded to by MR. W. MITCHELL; and "The Chairman," proposed by MR. BEN CARTER.

EXPANSION OF BUILDING AND CONSTRUCTION IN INDIA.

[FROM A SPECIAL CORRESPONDENT.]

THE "BUILDER" has always enjoyed an Indian circulation among prominent firms and officials, and its announcements are read with interest. Orders are sent through English firms and merchant-shippers in London, Liverpool, Glasgow, Manchester, etc., who pay and ship the materials. Indian constructors, engineers, builders, and architects are eager to secure sole-agents for suitable articles. Activity prevails everywhere and buyers are busy.

The construction of road railways on an extensive scale is to be taken in hand by the Gwalior State. Estimated cost of the railway, £800 per mile. The new reservoir project in the South Arcat District of Madras will, among other things, irrigate 25,000 acres of new land. Electric schemes are contemplated in Mysore to meet the demand for more power. As the City of Ahmedabad is extending, substantial additions are to be made for electricity, including buildings for three 750 B.H.P. generating sets. The last Punjab public works department returns show an expenditure of £1,363,950 on military works, civil works, post and telegraph works, archæological works, civil and deposit works. The new cantilever bridge between Howrah and Calcutta will, it is estimated, cost £6,380,000. A South Indian electric power project is being considered by the Travancore Government. Trincomalee as a naval store base instead of Bombay will gradually develop as a commercial port. It is one of the greatest natural harbours in the world. Large oil tanks and buildings are being erected.

Great activity prevails in introducing latest appliances and materials. An English provincial maker has six large firms in Calcutta stocking steam and power pumps of every description for contractors. American steel construction work is being introduced; also American tools and malleable fittings. Jointless flooring that can be laid upon wood or cement, fire resisting, impervious to water, white ant proof, highly suitable for railway carriage floors, is selling well. Also roofing for concrete: tiled timber and corrugated iron roofs are successful roofings for railway carriages. Demand exists for enamels, varnishes for floors, paints in all colours, wallboard for ceilings and partitions, flooring in dark green, red or slate colours, guttering, damp coursing for basements, steel rolling shutters. Business is done in ironwork paint against which rust is powerless. White or coloured Italian marble for builders, contractors, and engineers. Suppliers of suitable materials would do well to announce them.

Apprentices in Government workshops usually have a five-years' course; age limit 19. There is evidence that the old idea in India that manual labour and workshop duties are degrading and beneath the dignity of boys of good families is slowly breaking down. The workshop staff has had to use a good deal of persuasion and humouring.

Colombo municipal workshops have had machinery introduced, haulage plant, lorries; also steam street water sprinklers, which are cheaper than bullock-drawn vehicles. Up to March 31, 1923, registered in India were: 3,666 heavy motor vehicles, 37,903 motor cars, and 13,997 motor cycles. It is computed that one motor lorry is equal to 20 bullock carts.

COMMERCIAL MOTOR VEHICLE SHOW.

THE Commercial Motor and Roads Development Exhibition, now being held at Olympia, is so full of interesting exhibits that the following details can only give a slight idea of the extensive range of the exhibition. Berliet commercial vehicles, shown by Automobiles M. Berliet, of 40, Sackville-street, W.1, are represented by eight exhibits, of which four are chassis and four complete vehicles. The chassis are a 15-cwt., 30-cwt., 2½-tonner and a 6-tonner, and amongst these the 2½-tonner has the distinction of being equipped with four-wheel brakes. The 6-tonner is worm-driven, whereas all the others have spiral bevel gears as their means of final drive. The Berliet chassis will be found, upon examination, to have that neat and clean appearance which is typical of the majority of French chassis, a quality which is obtained as the result of careful forethought. It does not necessarily involve any decrease in accessibility. The complete vehicles include a saloon omnibus on a 30-cwt. chassis, a single-deck omnibus on a similar machine, an ambulance built to Local Government Board specifications, and a box van, the two latter being on 15-cwt. chassis.

The Bristol Tramways and Carriage Co., Ltd., of Bristol, show one chassis of each of the two models which they manufacture, as well as one complete passenger vehicle mounted on each type. In addition, there is a Bristol engine with the base of the crank-case removed so as to show the details of its construction. There is also a collection of finished parts as fitted to Bristol chassis, and a gearbox and a change-speed unit electrically operated and demonstrating the Bristol patent selector gear. Both the exhibits at Olympia of complete vehicles are passenger machines; one, on the 40 h.p. chassis, is a single-deck omnibus designed to carry 30 passengers and having front and rear entrances. The interior is divided into two compartments, that in the rear being set apart for passengers who desire to smoke. This vehicle is very well finished with domed wings and driver's cab with three-piece windscreen; it is equipped with electric lighting and runs on solid tyres. The bus on the 30 h.p. chassis is of the forward-dash type and has seats for 20 passengers.

The 20-cwt. to 25-cwt. chassis shown by Karrier Motors, Ltd., Huddersfield, is attracting a lot of attention. The construction embodies the unit-mounted engine and gearbox, the former being of 18.2 h.p. and the latter affording four speeds forward and a reverse. There is on this stand a pay-as-you-enter bus, with a capacity for 20 seats, mounted on a standard 2-ton 25 h.p. chassis, and also a special model of this chassis with 9-ft. wheelbase, and forward dash and body designed to be useful for the carriage of mineral waters and similar commodities. Other exhibits include model KV, which is designed for 5-ton or 6-ton loads, and JH, which is a 3½-tonner. The new 30-cwt to 40-cwt. chassis, which is built to the W.D. subsidy specification, is also displayed.

Renault, Ltd., have a very full stand of exhibits. The smallest is the 8.3 h.p. 5-cwt. chassis, which is shown as a boxvan and as a tradesman's van. The 13.9 h.p. appears four times on the list of exhibits, once as a 10-cwt., the other three being 15-cwt. Then there is the 24.8 h.p. chassis, which also appears in two capacities. This is shown in chassis form, the smaller having a capacity of three tons and being designed to have the engine beneath the driving seat, that is to say, it is of the forward-dash type; the other is for 3½ tons. A tipping wagon is shown on the 5-ton 24.8 h.p. chassis, whilst the twelfth and largest exhibit is the Renault 10-ton trailer and tractor. This also is equipped with a 24.8 h.p. engine, and the overall length of this exhibit is 31 ft. 5 ins.

The makers (Walker Bros.) of Pagefield motor vehicles exhibit an example which shows their ingenious system of refuse collection, which, introduced at Southport, is now being employed by municipal authorities all over the country. For the complete utilisation of this system, three horse-drawn collecting wagons, or containers, and one motor lorry are required. The container has a capacity of about 200 cubic ft.—say, three tons—and is designed to have a low loading level. When one of the containers is full it is taken by the horses to the motor wagon, upon which it is hauled by special arrangements of sliding ramps and winch. The motor lorry then quickly removes the loaded container to the tip, empties it and returns to pick up another full one. No special picking-up stations are necessary, as the exchange can be made in any ordinary road without interfering with traffic. The system is really a combination of horse haulage and motor traction, each in its most economical form, and it is, moreover, cheap and highly efficient. At Southport an actual saving of 1s. 11½d. per house cleared has resulted from the adoption of this system. A 3½-ton short wheel base chassis is also exhibited.

The Leyland exhibit is a most comprehensive one, embodying no fewer than seven vehicles, one engine and two models, representative of all types of Leyland production. The new 30-cwt. chassis appears fitted with a 'bus body and also equipped as a brewers' dray. The former has seats for 20 passengers, and is a typical example of this class of vehicle, for which the Leyland Co. have acquired a high reputation. The brewers' dray consists of an open body with the usual stanchions and chains which one associates with this type of vehicle. Another exhibit is an engine fitted to the new 30-cwt. chassis. This power unit is interesting on account of the advanced features of design, such as hemispherical cylinder heads and triple eccentric drive for the overhead camshaft, which are incorporated in its construction. Unusual flexibility as well as fuel economy are claimed for the power unit. The two models shown are an R.A.F. 4-tonner and a Leyland chassis fitted with a tipping body operated by Bromilow and Edwards gear.

The General Motors, Ltd., advertise that they are unable to show on their stand at Olympia a full range of their products, and although this statement is perfectly true, yet it cannot be denied that there are on their stand, and on those of firms allied with them in some way or other, a very representative selection of Buick, Chevrolet and G.M.C. commercial vehicles. They comprise a Buick 15-cwt. chassis and an attractive 15-cwt. van on the same substructure. There is also a traveller's brougham, neatly designed to give the same appearance as a private brougham and equipped with a wide door at the rear and long vestibule doors each side of the driver, and this also is on a 15-cwt. chassis. Amongst the G.M.C. exhibits of particular interest which may not be found on the stands either of General Motors, Ltd., or on that of General Motors of Canada, Ltd., mention must be made of the 15-ton G.M. tractor which is being shown by R. A. Dyson & Co., Ltd.

There are three vehicles on the Clayton stand, one of each principal type manufactured by Clayton Wagons, Ltd., these consisting of one electric vehicle and two steam wagons, one of the latter being an undertype and the other an overtype. The special features of Clayton electrics are the arrangement of the single motor unit, which has, combined with it, the countershaft bearings and the housing for the gears. The advantage of this construction is that there can be no trouble due to faulty alignment. The particular vehicle shown on the stand is a tipping wagon of the "run-back" type and fitted with steel body.

Those who are interested in the latest type of fire-fighting apparatus will be well advised not to miss the Dennis stand, upon which is staged, as one of this company's exhibits, a chassis of one of the latest type 60-70 h.p. 500-600 gallon fire-engines, equipped with the Dennis patent multi-stage high-pressure pump, which, amongst many interesting fea is notable on account of its light weight, h in mind its capacity. The pump is drive gearing which is mounted at the front en the chassis gearbox and enclosed in an alumi casing, the drive from this gear to the itself, which is, of course, located at the ext rear of the chassis, being effected by a cardan shaft, which is equipped with a fle disc joint at each end, and is supported at a the middle of its length in a journal whi carried by a cross-member of the main ch

The Sentinel exhibit includes no fewer five vehicles, all of them being new mo inasmuch as every chassis shown emb the new Super-Sentinel patent engine, w incorporates in its construction, amongst novel features, a differential, which is buil with the crankshaft. This is a most interes feature; the gear consists of a number of s and spur wheels disposed in and around crankpins and webs so as to give true differe action. An important point in its construc is the means whereby the differential is pre ted from functioning until a difference o per cent. or 15 per cent. of effort as between two chain sprockets is felt. It is claimed this arrangement abolishes 90 per cent. of tendency to skid. A full-size working m of this differential gear is on the stand, an well worthy of close investigation.

The exhibits of the Four Wheel Drive L Co., Ltd., comprise one standard chassis three-way hydraulic tipping lorry and a tipp trailer, a long wheelbase chassis with platform body, and a fire-engine. The tipp lorry and trailer are equipped with Bromi and Edwards three-way hydraulic tipping g which can be operated from the driver's on the lorry. The trailer is coupled to lorry by a telescopic tube with ball joint c nections. Both the bodies have sheet-s floors, so as to facilitate tipping the load, the design in general has been improved that the loading level is now 3 ins. less t that which has hitherto been customary. I important to note that both the lorry and tra are equipped with Westinghouse air-bral a feature of which is that, should the tra become accidentally detached from the lo the brakes are automatically applied to b vehicles.

The outstanding exhibit of Henry Gar Ltd., Birmingham, is undoubtedly the Gar Saloon Busvan. This is designed to be us on the one hand, as a comfortable passeng carrying vehicle; or, on the other hand, sol for the conveyance of goods; or, again, in mediately for carrying both passengers and go without inconveninence to the former or de ment to the latter.

The Dodge Bros. exhibit includes two cha and two complete vehicles. The former are 24-35 h.p. Dodge chassis and the Graham Br 30-cwt. truck chassis, which is fitted with Do Bros.' power plant. The small chassis ha four-cylinder engine of 3⅞ ins. bore by 4½ i stroke, three-speed gearbox with central chan multi-disc clutch and spiral-bevel gear. All brakes take effect on the rear wheels, wh are of the wooden artillery type, and acc modate 32-in. by 4-in. straight-sided cord ty The equipment includes electric lighting a starting, speedometer and tool kit. The ot chassis, of course, has the same power unit, its tyre sizes are 33 ins. by 4½ ins. on the fr and 36 ins. by 6 ins. on the rear. The 15-c panel-type van will be shown on a Do chassis, and a saloon bus on the Graham. T latter is by Hoods & Bodies, Ltd., and is the pay-as-you-enter type. Its capacity is 16 passengers.

The business of monumental mason carr on by the late Mr. James Gullett, of Holbo place, Plymouth, is being continued by M Margaret Annie Gullett and Messrs. Jan Gullett and John Ronald Hay Gullett.

E AND BLYTH DIS-RICT BUILDING ADES EMPLOYERS' FEDERATION.

annual dinner of the Tyne and Blyth Building Trades Employers' Federation, November 22, at the Grand Assembly Newcastle, Mr. Thomas Bertram the chair.

hairman proposed the toast "Our g Authorities," and said he believed lay there rested upon the governing greater responsibility than had ever en known in the history of the nation. e, however, worthy of confidence being n them. The houses built, it had been re not a credit to the governing s. Whatever criticism might be made, w perfectly well that it was unjust and If they had criticisms to offer they go farther afield. He expressed of members of the Tyne and Blyth n that Mr. Stephen Easten would have d strength to carry out the duties of office, as Lord Mayor of Newcastle.

ding, Mr. Easten said that many of o had criticised were men who had de anything in their lives. He wished e of them would come out and try to rk themselves.

Building Industry" was proposed by ff of Newcastle. They could, he said. it to themselves that during the most eriod through which they had passed been singularly immune from actual of work.

rsdike replied, and said the builders ountry had never valued themselves should. The Sheriff had very truly out that they had been singularly in not having any serious upheaval ilding industry, and for that they were ely indebted to the ability and foresight tephen Easten. Whilst the housing might be getting stale, houses were still nd he was one of those who believed ousing schemes had been left to those erstood housing the position would n a much more favourable one at the me.

W BUILDINGS IN LONDON.

(For rates of wages in the Building Trade in Scotland, see page 867.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

NEW INVENTION

THE "Teles" drag saw, illustrated h should be of considerable interest to th owners and those whose business inc cutting-up of trees. It is entirely o manufacture, and it is claimed that wit as much work can be done in a week as could do in a month without it. Tes shown that it will cut through a 45-in nine minutes, as against 45 minutes req perform the same work by two men hand cross-cut saw. The saw is furnish plete with engine and 5-ft. blade, or a blade can be supplied if required.

The engine is a hopper-cooled 4-cycl cylinder 1½ h.p. petrol engine, running revolutions per minute. It is fitted with tension magneto, and the speed is regul means of a very sensitive governor actin throttle. The engine can be used for oth when not required for cross-cutting. A r disc clutch, the same as used on motor furnished, and permits the engine to ru the saw is idle, thus saving time in stopp starting the engine. Among the special of the machine are: the guide handle holds the saw rigid while being moved, accidents; the long continuous tru extending from front to rear end, vibration and ensures increased strengt anchor hook is of special design, and g log and fastens the machine securely for An outstanding feature is that the saw on the opposite side from the engine which makes it possible to operate the r from the side opposite the saw, ensur operator against the danger of accidents machine is furnished complete ready wood. The clutch is detachable, and replaced by a pulley on the shaft. Th weight (packed) is 5 cwt.

New Drag Saw.

OSED NEW BUILDINGS.

(*Continued from page* 865.)

N (DURHAM).—Washington Coal Co. have using scheme for the benefit of their work- be Colliery, which is receiving encouraging approval from the men. The company provide sites free for employees, and to ges for transfer deeds, &c., and are to ost price all materials, together with rges. The purchaser will receive the Government subsidy, estimated at £73 d the houses, which are to be of three or with bathroom and garden, will it is ost £220 and £295 respectively. The osit on the agreement being signed will he company will receive interest at the ent. per annum on outstanding balances.

—Through the enterprise of P.iestman's d., who are at present engaged in the w colliery at Watergate, near Whickham, village is shortly to be created in that rs. Watson & Scott, architects, Newcastle, the company, presented to the R.D.C. n showing the lay-out of approximately providing for 295 houses, or 12 houses range of shops. The plan was approved.

Whitby builders, after conference with n Council, have decided to proceed with f 14 subsidised houses on the west side, lications have been received for sites on Estate on the east side. The work, the erection of the war memorial, cottage a large ballroom at the Royal Hotel, is ommence at an early date.

MPTON.—Thirty acres of land on the Estate, near Wolverhampton, adjoining arne Estate, are about to be developed ration for housing, the Ministry having cessary sanction. The construction of ers will be carried out by direct labour.

.—The E.C. have had reported to them d Buildings Sub-Committee the necessity room and new out-offices, at an estimated for the Badsey C. School.

—An inquiry has been held by Mr. A. W. n behalf of the Ministry of Health, with an application by the Corporation for rrow £5,870 for the purposes of an open- bath and eight additional slipper-baths. C. have made application to the M.H. o erect 200 houses. The Ministry have ioning an immediate start to be made

FIRES.

.—The Public Hall, London-road, one of ent centres in the town, has been fire.

H.—A fire has destroyed the corset ging to Messrs. Charles Bayir & Co., Ltd.,

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Ayr.—Plans have been forwarded to the Board of Health for their approval for the erection of 50 two-apartment houses.

Girvan.—The T.C. has decided to erect 16 two-apartment houses and 12 three-apartment houses, making a total of 88 new houses in all under the municipal scheme.

Turriff.—The T.C. has decided to erect four houses, the plans for which were prepared by Mr. W. L. Duncan, architect.

Arbroath.—The Forfarshire Education Authority has agreed to erect a hut for a new classroom at Arbroath High School. The cost is estimated at £178, excluding the heating apparatus.

Bishopmill.—The Moray Education Authority has given instructions to the Clerk to obtain estimates for providing an additional cloakroom for the children, and a retiring room and lavatory accommodation for the teachers at Bishopmill School.

Largs.—The T.C. has decided, in view of the expenditure proposed by the London, Midland & Scottish Railway Co., to draw the company's attention to the inadequacy of Largs Station, which was erected in 1885 as a temporary erection, and to suggest that the existing wooden structure should be replaced by a station constructed of stone.

Kilsyth.—William Baird & Co., Ltd., coalmasters, have stated to the T.C. that they intend to erect 50 to 60 houses on the two-story tenement principle, in substitution for what is presently known as the "Brick Rows," and have asked the Council to grant £100 for each house. The London & North Eastern Railway Co. has also informed the Council that it intends to build houses, and desired to know what the Council is prepared to give for a subsidy.

Musselburgh.—The T.C. has decided to erect a golfers' pavilion on the links.

NEW COMPANIES.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXV.—No. 4218. DECEMBER 7, 1923.

WAYS AND MEANS.

"The World is so full of a number of things
I'm sure we should all be as happy as kings."

is one of the privileges of youth that the young architectural student can believe that art, and the enthusiasm for it, must suffer when ways and means have to be taken into account. The mind which tries to translate architecture into dull terms of wages and capital seems student to provide nothing but dry bones to stimulate eative mind. It is true that the student working at his g board approaches nearer to that elusive ideal of art 's sake than his employer wrestling with administrative ms incidental to the earning of a livelihood in the profes- f architecture. The increasing number of economic and problems which have appeared during recent years have harassing to the architect, and it is because we suspect e has become a stern realist, whether he is aware of it , that we deal so frequently with these problems.

ese thoughts occur to us in reading Mr. Strachey's book on nics, which we review on page 892. Here is a refreshing of economics written in a manner so attractive and simple despite what we have said about the idealist and realist, should be no excuse for those who believe that they abhor dismal science." The title, "Economics of the Hour," seem to indicate some immediate remedy for the ssing industrial conditions of the moment, whereas its cance to us is that the time has now arrived to state y some home truths in political economy, a science which to have been omitted in our promised post-war Utopia. ist have become obvious to everyone by this time that h our ideals of a better England may have been praise- y, it was not in the power of anyone to give conditions ing the maximum of comfort with the minimum of r. Political Economy is claimed by many to be a science, e know of no other science where it is so easy to invert and effect and build up theories based upon a fallacy or adox.

uring recent years we have all become experts in culti- narrow areas, preferring to seek any excuse and turn to emedy, however complicated, rather than accept a dis- able diagnosis which might involve harder work, longer or less payment for our labour. We can all discuss ems like inflation and deflation, nationalisation and dualism, craftsmanship and mass production, alternations oms and slumps, as if we were discussing sides in a Univer- oat race. We surely know all there is to be known foreign exchanges, stabilisation of prices, Government lies, safeguarding of industries; and to all of them we turned at various times in the belief that each of them he secret of our industrial depression. We do not mean dicate that because Mr. Strachey avoids these modern ms he merely restates an old creed; on the contrary, it old enough to appear new to this age, brought up on t remedies. Many of the conclusions we know have held privately by the few, and their silence can best be ned by the fact that experience proves that a nation has just come through a long and arduous war success- is seldom, in the first flush, in the mood to accept dismal day facts, but prefers for a time to dally with an easier ophy which promises better conditions for less labour.

r. Strachey confirms a belief which we hold and have sed on several occasions, that the only way of increasing wages permanently is by increasing production. It is us that our trouble to-day is that we are not producing ch as we could, or, in other words, there is not the demand at the price. During recent years we have seen the tendency on the part of labour (encouraged by idealists) to submit their requirements, both economic and social, as a first condition in the scheme of things, in the belief that these are the governing factors. The result we see to-day; the fallacy being responsible for prolonging the industrial depression from which we are all suffering. The cost of labour, i.e., cost of production, is clearly a governing factor in the price of the article, but it is equally true to say that it cannot ensure the demand if we are not in a position to pay the price. We proved during the war that we could exist without many things, or make them last longer, thus enabling the nation to concentrate upon war material. By doing without many things we paid a large amount of the cost of the war.

We have built up an amazing philosophy in recent years. We want to increase the happiness and prosperity of the poor, provide better housing, better schooling, better living, better health, more leisure, more freedom, more opportunities for enjoying the good things of this life. Enveloped in this atmosphere it is almost impossible for the individual to see the problem from a neutral and objective standpoint. Gradually he succumbs to verbiage, until in the end he can only listen to dialectical refinements about a truer freedom than being free. No one can deny that we have given this philosophy a fair test, even to the extent of bolstering it up by paying unemployment doles out of public funds. In the post-war deflation we see a general desire to make a stand at a level beyond the diminished purchasing power of the country, and when faced with the serious problem of unemployment we prefer to clamour for help from the Government, regardless of any principles upon which our whole industrial fabric is based. It is beginning to appear that there must be some serious flaw in our economic programme, and surely the time is ripe to study once again an old theory—that improved conditions or real wealth can only be measured in terms of production.

Any doctrine which enjoins the worker to contribute to lower prices is not fashionable, we admit, and at first sight it seems bitter medicine to offer when we sympathise with the worker in his discontent. The economist must, of necessity, seem hard and unsympathetic, but the sentimentalist, who is genuine but often mistaken, does not monopolise all the human qualities because his doctrines are popular. That Mr. Strachey had these ideas in his mind when he wrote his dedication we feel sure. In a world where values are comparative, we may some day find that the conditions prior to the war were not so bad as they appeared when the glittering future was dangled before us. It is true they were not so good but what they might have been better, but human progress and development did not end in 1914 because it was made to appear that it was a sudden discovery in 1918. Civilisation is all the while improving, and the whole difficulty to-day is not that we are reaching too far in our ideas, but that we are neither certain what we mean by better conditions, nor how they are to be obtained. In a letter in *The Times* of November 5, Lord Hugh Cecil deals with the problem of unemployment, and it is interesting to note that he confirms the general theory which we are discussing. The whole problem resolves itself into the question of how long we have to wait until these principles will be understood and accepted. In the meantime, we are doing everything we can to help the worker to prolong the depression. Salvation can only be found in a good will founded on common interest: in human relations between employers and employed; and in adopting an economic philosophy which is not based upon popular fallacies.

NOTES.

Proposed Exhibition of Architecture at Wembley.

We refer elsewhere to a proposed exhibition of architecture at the Empire Exhibition. But we are told it is to be strictly limited as to space, and to be limited to photographs and models, and also to be limited to those who are invited. This three-fold limitation is the reverse of encouraging. At the Ghent Exhibition, shortly before the war, the galleries devoted to architecture would probably have held nearly all the Royal Academy pictures. The drawings were fully displayed and the whole effect was as pleasing and dignified as our usual architectural shows are dull, crowded and mean. Of course, only executed works will be shown at Wembley, and only such as come from architects whose work is appreciated by the selecting committee.

Advertisement for Architects.

Among the many things offered in the abundant fare of after-dinner speechifying, on the occasion of the fifth dinner of the Architecture Club, Lord Riddell volunteered some advice—more useful perhaps to architects than to architecture—to those who feel the need of other than the accustomed ways identified with the profession for getting hold of work. To some of us, none the less, this subjecting a noble art to the flacid interpretations of after-dinner oratory, with the idea of encouraging it, is a matter of some surprise. His lordship's proposal that the architect should sign his building is not amiss, and has some warrant in old tradition, though some of us more intimate with architecture can read the architect's signature all over the building. But this hardly meets the needs of a commercial age, and he makes the suggestion that architects should advertise themselves more freely in the editorial columns of the Press. A course of "window dressing for beginners" plus the publicity agent should suffice, and if architecture cannot speak for itself, let the publicity agent take its place. Or does architecture not need to be saved from such friends! Seriously, this is not to the point, and such proposals can come only from those who know little of the nature or the obligations of this great art. The astounding thing to us lies in the fact that a number of p and distinguished persons should n that architecture is very badly serv such friends, and that in lending selves to this sort of publicity for tecture with the idea of aiding it may be doing it very bad service.

"Hideous" City Churches.

If the interview with Hugh Cecil was cor reported in the *E Standard*, the opinio that eminent layman must be profo disturbing to those concerned i defence of the threatened City chu "Some of the churches," he tell "are very beautiful, and ought not touched, but some are very u frankly hideous." Now, referen authority in all matters of art val extremely difficult, but this calm ance of *fiat lux* in face of an a unanimous architectural judgme "frankly, very hideous," and were for the strong influence exerted by Hugh in ecclesiastical affairs wou too silly to bother about. But let be no mistake, the attack that is c is very real and admirably camoufl No one can deny the needs of G London, the poverty of the clergy the responsibility of the community justice to both; but the policy of representing the official Church att is not one to enlist the support o sympathetic layman. It is at material and yet sentimental. I Church authorities were to come fo and say—"here are Church and na treasures, help us to defend them can't, alone," their case would be s Instead, what are we told?—they ar treasures; they can be moved some else; perhaps they needn't all b stroyed—while the whole questio mixed up with ecclesiastical proce including the amazing suggestion tha four new rectors would (according to Hugh) "be the best judges as to would be done with the churches, which of them were really superf and could be removed." Were it n the very real danger, the scene this gests would be fit copy for comic o

Over-Production and Unemployment.

Many people have won how the science of e mics earned its reput for being the prosiest ject on earth, when its s ought to illuminate many of the difficult problems of the day. One o reasons put forward is that the att to interpret economics by making fresh and lively for the benefit of com folk invariably ends in the aren politics. Hence the theory that science of economics is studiously avo by politicians, on the principle that more essential to take sides in a c than believe that the issue can be se

at the Fine Art Society's Gallery.

Silver Bowl. By GEORG JENSEN. (*See p.* 895.)

natically. A classic example can in the contention that over-pro- is responsible for unemployment. lacy comes naturally to the worker, es that a particular job would be l among more workers if each man s of it. Assuming we could prove a to be fantastic and absurd, the will not accept an argument which that low wages are better than nemployment. There is a principle e, apparently, and there issues the ring argument that the lowering es may secure re-employment for oment but it leads to a lower rd of life; unemployment in due eturns with undiminished severity, a population sinks deeper and into poverty. Here are the argu- put crudely; and we can see that sues are so wide and the battle so popular that the politician is abandon a cause which he thinks be settled by common sense. The nt that "you have a perfect right vrong" is little more than a felici- pigram in political circles, but it nean a great deal more in the nic world. In a world which is all ven to easy half-truths and popular rities, we need not lose our belief an progress, though we may, with , be disbelievers in short cuts.

hitec- Anno- ons.

IN his cosmopolitan volume of "Reminiscences," just issued by his old friend Mr. Macmillan, Dr. A. J. Sayce, of Queen's College, Oxford, some- Professor of Assyriology in the rsity, records interesting particulars repeated explorations in Egypt and ere among the ruined structures of ncient origin, and particularly con- g his archæological survey with omers Clarke (Surveyor, after Mr. se, to St. Paul's Cathedral), at on the west bank of the Nile, from Halfa to Dongola. The architec- side of their programme was ted to Mr. Somers Clarke, who had is dahabia and built himself a winter nce within an easy ride of El-Kab, Dr. Sayce had been his guest. explored together the country en the First and Second Cataracts 893–4, when Mr. Somers Clarke ured plans of the local temples and other historic buildings on both banks of the Nubian Nile. The far-travelled author of this book entertains his readers with a very varied series of home notes and among these occur a few personal incidents about other architects known to him.

Ruskin, Butterfield, Scott and Burges.

SIR HENRY ACLAND took a leading hand in founding the Museum of Oxford University during the fifties, built under the auspices of Professor Ruskin. Deane and Woodward, the famous architects, designed the buildings. The roofs were gay with purple and greyish-green slates symmetrically patterned and arranged, while the Bath stone mural treatment was relieved by marbles of various hues. Ruskin prevailed, but the result was much criticised as being alien to the traditions of Oxford. Strange to relate, notwithstanding this incongruity of style, Ruskin told Dr. Sayce that he could no longer take his usual walks past the Museum or enjoy his customary afternoon stroll in "the Parks," because William Butterfield's "streaky bacon" buildings for Keble College "made him feel sick." Keble's architecturally striking chapel, anyhow, made some amends for the deficiencies of the rest of its College buildings commenced in 1868. The late Dr. Creighton, Bishop of London, when he saw the interior of Keble College Chapel on its completion, remarked "Well, Butterfield has successfully solved the problem how to cover a wall with all the colours of the rainbow and yet leave it bare."

Building "Rings."

THAT the natural effect of competition is towards establishing the real economic prices of a thing, and that in the free play of this force there is some security against the artificial use of prices through combinations, few will deny. When this factor of competition does not exist, as in the case of combines, we are dependent on one of two things to secure a fair price; either that the members of such combine are animated by so much public spirit that we can depend on them not to use the control in their hands against the public welfare, or that a Government Department, probably the Ministry of Health, will intervene to control prices. The recently reported Exeter case (though as the builders say, there is nothing new in such an example) emphasise the fact that such combinations are by no means exceptional. "Rings to control prices" are not limited to builders. The Standing Committee appointed to investigate prices and trusts found that in connection with the building trade there were many associations in existence, and they thought that where 60 per cent. of an industry was controlled by associations steps should be taken to safeguard the interests of the nation. To take such steps is, however, very difficult. After all, it is a question of human nature. In the end it is in the slow emancipation of humanity to better objects, more essential values, that the remedy lies, and we must look to the forces of religion, education and citizenship to prevent humanity preying on itself.

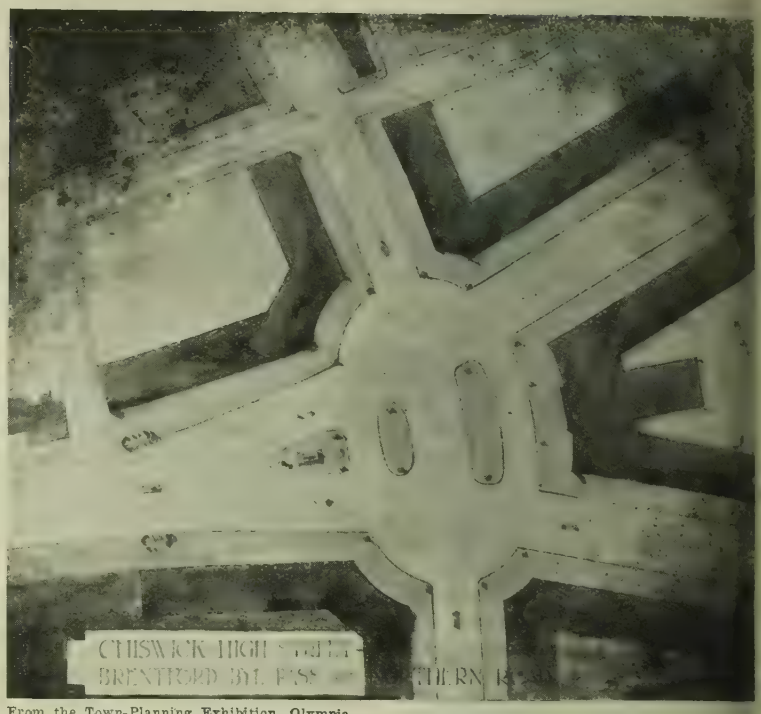
GENERAL NEWS.

Professional Announcement.



After Thursday, December 6, the address of Mr. Arthur Boxall, quantity surveyor, will be Lloyds Bank Chambers, 2, Henrietta-street, Covent Garden, W.C. 2. Telephone, Gerrard 8866.

Antique Furniture.

Mr. Mordaunt Rogers, F.S.I., F.A.I., gave his second and final lecture on this subject at the College of Estate Management last week. The lecturer traced the history of French furniture down to the time of the Revolution, which put an end to the age of furniture in that country. Mr. Rogers dwelt on the outstanding characteristics of the various periods of English furniture, and pointed out the way in which these were influenced at different periods from both France and Holland. The lecturer illustrated his remarks with a large number of lantern slides, which were kindly supplied by the authorities of the Victoria and Albert Museum.

Law of Property Act, 1922.

Mr. A. F. Topham, K.C., recently delivered the first of a series of three lectures on the above subject at the College of Estate Management. He said when the Act came into force so far as the general public was concerned, there would be very little difference to be seen. He traced the history of the attempt to simplify the transfer of land, starting from the Commission appointed in 1833 for this purpose. It had, he said, long been realised that it was impossible to simplify conveyancing until the law relating to land had been simplified. That had been done in the present Act by limiting the types of tenures; that was, by this Act, there were only to be two estates at law, the fee simple and the lease, all other estates and interests taking effect in equity only.

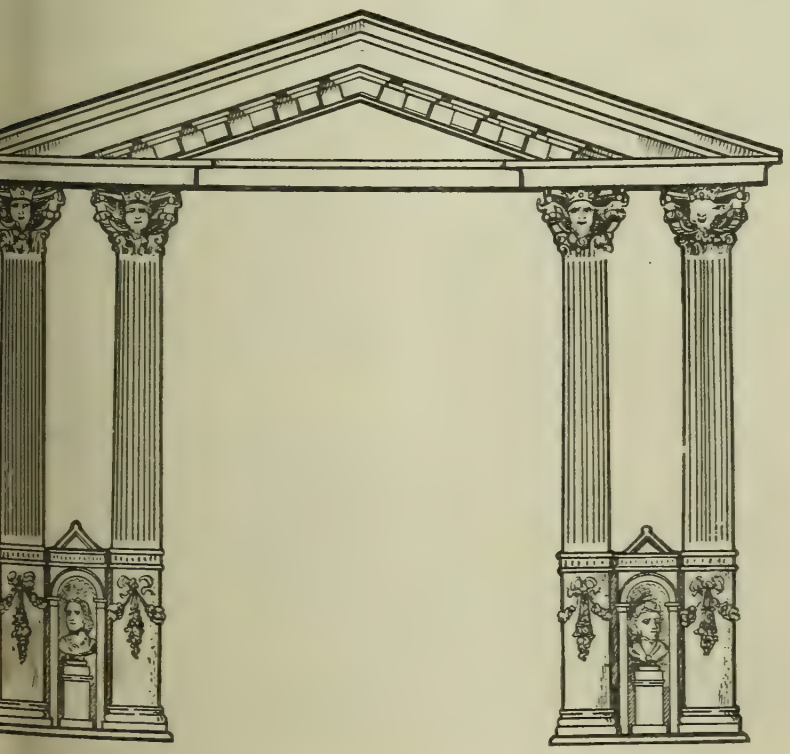
FROZEN MUSIC.



By MANNING ROBERTSON, A.R.I.B.A.

TECTURE has been called "frozen and most people will agree that constant n has invested the saying with some f authority. This being so, it is instruc- nalyse the particular icicle which can l on the programme cover of one of the series of classical concerts to be found orld. What kind of music is it that has zen into the solidity illustrated on this What can have been the origin of a com- such as this? Let us melt it down o music and see what we get—a pseudo- composition, played without a con- by performers who have hardly seen struments before, some playing in , others in B minor, many of them their scores upside down. Such is the ure, read in terms of music, that is set ie public to illustrate in architectural musical treat that is in store. Seeing music thus caricatured on the cover of some of the world's greatest master- splendidly performed, how can we for this amazing discrepancy between d contents? If it is argued that the n the outside means nothing it would e better to leave the page plain. is pictorial blunder we must blame the surrounding the various arts; they like islands, each with a self-contained with difficulty to discern the hazy out- ie others, but unwilling to admit that ie others can exhibit more than a hazy en to its own inhabitants. One does to stress the shortcomings of this par- rogramme cover; indeed, to criticise it ike hitting a deformed baby; the utter r of the design is in perfect keeping with ty of every detail, without one single n. The shafts, for example, are square, and the designer, having that columns are often fluted, thought be a good idea to have flutes here. nany?" he must have asked himself. rer (whatever it was) to this question to compromise by putting ten on the left, eight on the extreme right, eight on le left, and seven on the inside right. Again, take the little beetles, evidently of different ages and sexes, running up towards the flutes. There are eight of them under the ten flutes on the extreme left, six under the eight flutes on the extreme right, eight under the eight flutes on the inside left, and six under the seven flutes on the inside right. Could absolute originality be carried farther? Here there is no convention, neither one beetle per flute, nor even a fixed beetle-flute ratio.

As to the other details: the shafts rest on prodigious tins of Keating's, of different sizes, and we recognise old King Cole in the capitals that support a pediment which has not a fellow in the world. One wonders whether it ever occurs to those who draw such objects to go and look at a pediment, of which there are thousands in London; they would probably say that they had as much right to design a pediment as anyone else, and that if their's was unlike the others, so much the worse for the others. Admittedly the designer of this cover is entitled to do what he likes and as badly as he likes, in the way of drawing pediments, just as I may write down any arrangement of musical notes that may enter into my head; but herein lies the difference—I cannot make him and his abettors listen to my musical compositions (if I could they would hear, and hear often, such a symphony as would at least equal the pediment), but they can, in effect, make me look at their architecture; I, however, can only escape by staying away from the concert, or at least refraining from buying a programme and averting my eyes from that of my neighbour.

The principle of illustrating a piece of architecture on a musical programme, thus making one art assist the other, is excellent, and admittedly this design is in the nature of a compliment. Architecture is called upon to add dignity, and to assist in creating a receptive mood, instead of being, as usually happens, ignored altogether. Music complains of public ignorance and indifference; architecture does the same; and, since charity begins at home, one might hope that these two would at least sympathise with each other in their common distress; but of what use is it for good music to employ a travesty of debased architecture? Not only have those musicians in authority sanctioned this no doubt well-meant effort, but thousands of musicians have accepted it without a protest. If the musician employs this kind of symbolism to prepare his audience for the Choral Symphony, the architect might follow suit and help to instil a sense of mysticism and worship into a congregation by playing a defective comb in Westminster Abbey.

Probably the man who actually perpetrated this portal to harmony had no more knowledge of music than he had of pediments—he may have been merely a lost soul; but the misfortune is that the arts are so little interlinked that an architectural Caliban, which would be rejected by a pavement artist, is still allowed nightly to confront immense audiences as an example of "architecture." The architect's real grievance is not that his own sensitive eyes are outraged, but that at the very time when everything is being done to interest the public in architecture she should be betrayed by her twin sister.

Cover of a Programme of a Musical Entertainment.

THE GARDEN CITY.

THE following is a summary of the seventh of the series of lectures on Town Planning given by Mr. Wm. Haywood, F.R.I.B.A., at Birmingham University:—

Mr. Ebenezer Howard's conception of the modern garden city was in the same class of ideals as Plato's "Republic," St. Augustine's "City of God," More's "Utopia," and such projects for social reformation as those of Andreae and Swift in the seventeenth and eighteenth centuries; and Bellamy, Butler, Morris, and Buckingham in the nineteenth century. It differed from all these, however, in having surmounted the difficulties of practical demonstration; an achievement greatly aided by the pioneer work of Mr. George Cadbury at Bournville and of Lord Leverhulme at Port Sunlight—both of which communities were initiated about 1887-8. The first garden city of Letchworth was inaugurated in 1903.

The term "garden city" had been much misunderstood by the public, which appeared still to be unaware that towns like Letchworth and Welwyn—true "garden cities"—were self-contained and fully independent, standing upon land owned jointly by their citizens (or held in trust for purchase by them at their convenience); that these cities were artificially limited to an ultimate population of between 30,000 and 50,000 inhabitants, and that they were restricted in area by a permanent zone of open country, forming an agricultural belt for the health and mutual convenience of the grower and buyer of market produce. Therefore the term "garden city" stood for a policy rather than for a type of planning—a policy designed to oppose the evils of overcrowding, the exploitation of land values, and the growth of great cities, by substituting fully detached, self-supporting, and healthy communities as satellites of great towns, or as independent cities.

A "garden suburb," unlike a "garden city," was an integral part of a larger community, and, therefore, subject to control by those outside its boundaries. It was also more or less dependent on this larger community for certain social, educational, and occupative facilities; it might be simply a residential or dormitory area for the parent city, as in the case of Hampstead, London; or it might be practically self-supporting, as at Bournville, which, save in the matter of separate administration of the Letchworth type, approached the garden city condition very closely.

A resemblance between the two kinds of town growth described above, which was apt to mislead the public, was the method of planning for houses and roads which was common to both; this method was now common to all town-planning schemes. The special quality distinguishing true garden cities consisted in the adoption of Mr. Ebenezer Howard's policy of administration.

CORRESPONDENCE.

Cambridge Collegiate Buildings Competition.

SIR,—We should like the readers of your paper to understand that we are not in any way associated with Messrs. Holt & Rees, of London, who were competitors in the above.

We have never written to the Press to complain about the assessor's award in any competition we have entered, and we are entirely in sympathy with the opinion expressed in Professor Reilly's letter on this subject.

T. TALIESIN REES.
RICHARD HOLT.

Liverpool.

Charlatans and Pests.

SIR, — With reference to Mr. McArthur Butler's letter, I regret if I have done the Society of Architects an injustice by suggesting that it has done nothing towards securing the work of local authorities for members of the profession.

Mr. Butler states that local authorities were circularised twice. Why was this policy discontinued until the whole of the architectural work had been wrested from the hands of road and sewer men and placed in the hands of architects? Would the doctors of this country be content to rest on their oars if municipal medical work were in the hands of veterinary surgeons and chemists?

At the present time numbers of County and Borough Surveyors, City Engineers, &c., are responsible for the architectural work of education authorities, housing schemes, and numerous other building works. Is the Society content for this architectural work to be lost to the profession?

It may be argued that, when a town has to erect a large building, an architect is employed. In many cases this is so, and a qualified man —designated "temporary architectural assistant"—carries out the work. The surveyor's name appears on the drawings and in the Press reports, and the architect, unhonoured and unsung, receives a month's notice when the contract is completed. Is the Society satisfied that members shall act in this capacity for the benefit of local surveyors?

Again, the medical profession take strong action in any case where municipal posts are advertised at inadequate salaries. Does the Society attempt any action when architectural posts are offered at low rates of pay?

It might appear to the architect in private practice that this municipal work does not affect him. An official architect might appear to be as detrimental to his interests as a Borough Surveyor doing architectural work. I venture to state, however, that once local authorities are convinced that the best results are obtained by engaging architects to carry out their legitimate work, then private individuals will follow suit and a general increase in the number of clients consulting architects will take place.

Why is the architect debarred from competing with the surveyor on equal terms? A member of the Surveyors' Institution may practise as an auctioneer, estate agent and architect. He may also advertise. Is there some secret pact between the Institution and the Society whereby members of the latter are delivered into the hands of the former, bound hand and foot?

With Mr. Butler personally I have no quarrel. I have found him most willing to help members in every way possible, and realise that the present policy of the Society is not necessarily his own. I would ask him, however, to tell members what action (if any) the Society is taking to obtain the whole of the architectural work of the country for architects in general and members of the Society of Architects in particular? If no attempt is being made to do this, then, in my opinion, the Society fails in its duty to its members and cannot expect to hold its own with other professional bodies.

C. F. OVERY, M.S.A.

Housing and the Labour Party.

SIR,—I have read with care the article in your recent issue, wherein you castigate the policy of the political Labour Party in the matter of Housing. It is a debatable question whether it is the function of the professional and trade Press to deal with such matters from the political as opposed to the technical standpoint. As, however, the precedent has been set, and is being widely followed, perhaps you will, of your courtesy, allow me a little space for the expression of a contrary view.

So far as I can gather, the main objection you cherish to a State scheme as opposed to a private enterprise, is based upon the assumption that the former is necessarily wasteful as compared with the latter. We may agree that in the pre-war days it was possible for the private speculator to erect working-class houses and to let them at a figure at once within the means of the tenant, and yielding a reasonable return to himself. Be this as it may, the conditions to-day are, as you admit, entirely different, and in the opinion of many of us the National or State Scheme offers the only practical solution of a problem of terrible urgency.

You make much of the wastefulness of the war period, and argue on the assumption that similar wastefulness must be an inevitable condition of all public enterprise. May I, as an architect who has been a soldier, suggest that "blackmail" is a rather better word than "waste" in this connection? While a vast number of our men were risking their lives, health and worldly fortune, others in the security of the homeland availed themselves of an exceptional opportunity created by the state of war to feather their own nests. It is true, unfortunately, that the Governments of those days made many bad bargains to the disadvantage of the public purse, but, Sir, bargaining takes time, and, with lives in the balance, certain persons were able to demand and receive payments for their supplies which bore no just proportion to real value, and which, as compared with the fighting man's pittance, amounted to a gross scandal. Do you really think that a Labour Government would permit these persons and others of their ilk to repeat their performance in times of peace? You refer to the Addison scheme, which, although damning it with faint praise, you admit to have set a high standard. You are greatly upset on account of the ever-expanding cost of such schemes, but you do not explain the causes of such expansion. Well, Dr. Addison has been thinking; he has realised the cause of the increasing cost, and has been led to feel like many another man of education and vision, that the Labour Party's policy is the right one, and has associated himself therewith.

I suggest, Sir, that it is high time the nation realised that the men who most need the houses, and the work of building them, are for the greater part those who in the dark days gave themselves in service to her. To-day it is up to England to honour herself by making some real attempt, as a nation, to redeem her many promises.

Money is short, we know, but a debt of honour is a first charge. This is not primarily a matter of £ s. d.; it is, or should be, a first charge upon our corporate conscience.

Surely England has a soul.

F. R. I. B. A.

London.

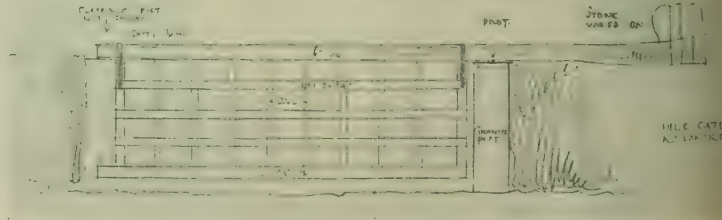
W. W. SCOTT-MONCRI



Field Gates.

SIR,—The recent letters and illustrat *The Builder* have been very interesting, thought you might care to make use enclosed drawing I made when at Landr 1918. It was measured and drawn on th and is different in some respects fro mentioned by your correspondents; he will see that the lattice portion is secure iron strap to the top. In the case I s gate opened into the field and the butt the tree swung out over the greensw clapping post stopping and securing the ot of the gate.

THE TOWN-PLANNING EXHIBITION AT OLYMPIA.

By W. R. DAVIDGE.

MPIA is a place of vast spaces and ally so now that the new additions to the ng have been completed. The whole of allery of the new portion was given up Town-Planning Exhibition, but, even so, not easy to find one's way to one or the of the stairs giving access to the galleries the Exhibition was on view. Once though, it was evident that the pilgrimage vell worth while. The Exhibition was ily one of the best got together in recent and the material collected was for the part of essentially practical character, h one missed, perhaps, the huge pictorial ns which were such a feature of the first Planning Exhibition on the walls of the Academy in 1910. Much practical work, od work, has been done in the last thirteen n the direction of town planning. Arterial and road widenings have gone ahead all the country. Practical object lessons d everywhere, so perhaps there is less o appeal to the poster artist than formerly. ombination of colour and form in the tation of large maps and diagrams is subject better understood on the Continent e United States than it is in this country. ractical work, though, which has been nd is being done in the matter of town ng the world over speaks for itself, and xhibition at Olympia was but another that a world-wide movement of this tude gathers momentum as it goes.

n planning, after all, is essentially a on-sense problem and the problem of roads is essentially a branch of town ng. Hence, one can well understand how an important body as the Commercial Manufacturers came to give up so large an area of its Exhibition to the subject of town planning. The arrangement of this section of the Exhibition was in the capable hands of Major Hardy Syms, F.S.I., and his committee, and he was no doubt largely influenced in his scheme of arrangement by the interesting Town-Planning Exhibition which took place in Manchester last year. The great difference, though, between the two exhibitions was that at Manchester entry was free to all the citizens, young and old, who thronged the Town Hall daily; while at Olympia, from the nature of things, entrance was by ticket only and very largely confined to the invited few, though there was a large sprinkling of municipal engineers and others whose work brings them into touch with the problem of town planning. The *pièce de résistance* of the whole Exhibition was undoubtedly the great floor model, prepared by Professor Adshead and his students, showing one-eleventh full size the Brentford By-pass Road (the Great West Road). The professional model-makers will have to look to their laurels.

In the section dealing with civic survey as a preliminary to town planning proper, the value of aeroplane photographs is becoming clearly apparent and the time is undoubtedly approaching when every town will possess its periodical photographic record, showing pictorially and graphically the development of the city. Civic survey diagrams will be even more attractive than they are when they appear as actual photographic records of the town itself. The diagrams of New York, showing the density of population at various dates, proved the steady outward trend of industrial and commercial development, pushing out before it, like a glacier with its moraines, the congested areas where the poorer workers live. The city of Bradford had a fine series of maps showing present conditions and the way in which improvements are being steadily effected, despite difficult conditions as to topography and overcrowded humanity. The interesting little survey of Newbury went back to the beginning of things, and it is well in all towns to realise the reasons which brought the town at first to its present locality, and secondly, the reasons which have kept it there and are keeping it going to-day.

Mr. Pepler's interesting diagram showing the extent of town-planning schemes and regional-planning schemes all over the country showed what widely varied towns and regions are at present hard at work on town planning all over the country, and lends point to the recent suggestion of the R.I.B.A. to all its members that architects, of all people, should be taking a hand in this great movement which is going on everywhere. The diagrams showing the system of notation adopted by the Ministry of Health will help to standardise the colours and method of presentation of plans for the approval of the Ministry, but if insisted on too closely may eventually be found to stereotype the planning as well as the plans.

Birmingham and Manchester both prepared a useful series of maps showing the present utilisation of the surface in the neighbourhood of the city, and Cardiff made use of aerial photographs to very good purpose.

Even distant Lucknow made use of the aerial survey to indicate the comparative densities, and here we had an example, rare in Western lands, of a large city partly fallen into decay, largely through the loss of its position after the Mutiny as the capital of the kingdom of Oudh. Of foreign cities Vienna and Paris showed interesting examples of civic survey work. In the illustrations of schemes under the Town-Planning Acts, ranging from Leicester to Glasgow, there were many points worthy of note, though the Ordnance Sheet itself did not convey all the facts to the eye of the passer-by.

The Southgate Town-Planning Scheme was

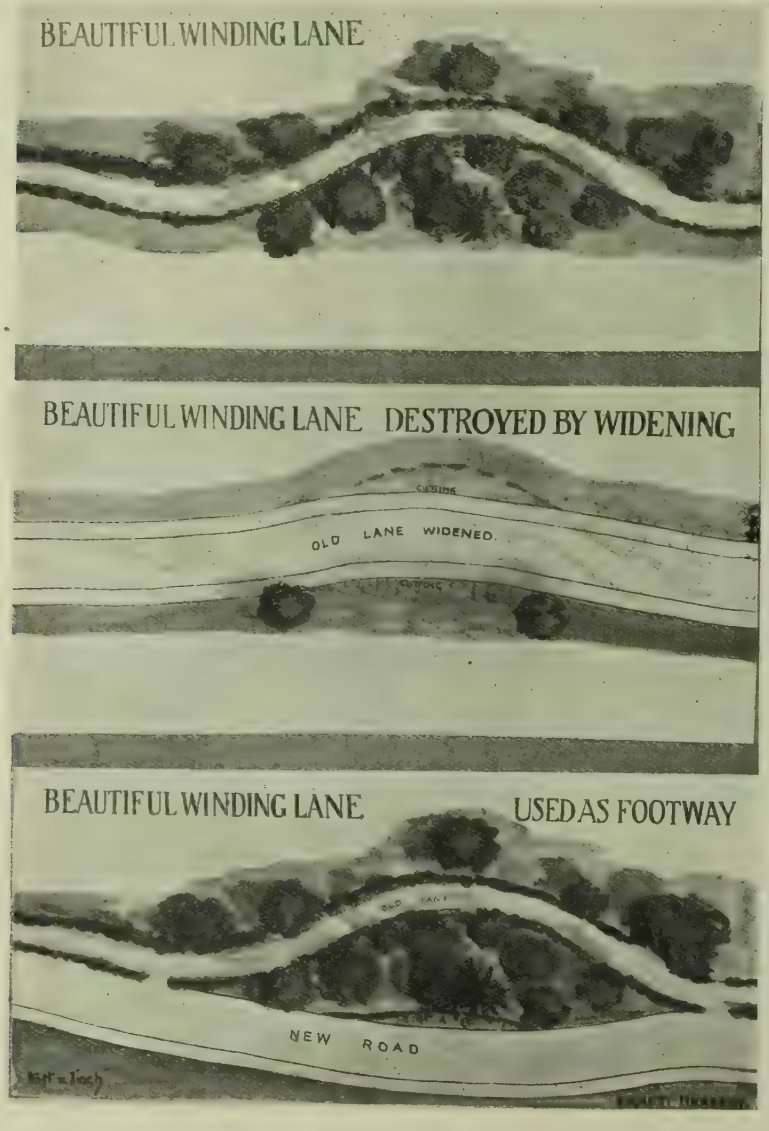
Rotherham Region: Portion of Contour Model.

Bombay : Model of Back Bay Reclamations.

particularly interesting as an example of suburban development, in which the most was made of parks and open spaces. A contour model, however, even to the technical eye, is a very great help to a rapid grasp of the three dimensions that actually have to be dealt with on the site. The model prepared for the Rotherham Regional Planning Committee, of which an illustration is given, proved particularly useful in solving many of the problems, and such a model amply justifies the moderate outlay involved. The foreign examples from the larger cities of the Continent were one and all prepared in the pictorial style and excellently presented, the outstanding examples being those exhibited by the cities of Zurich, Breslau and Stockholm, and the Dutch city of Ysselmonde.

In all these, the massing of the colours on the town and its surrounding park lands re in a most pleasing result. The large model of Gothenburg, Sweden, showed could be done with the assistance of a p model in aiding the eye to take in di topographical problems. The blue wate the brown roofs formed a fascinating *coup* of the city of Gothenburg.

Professor Adshead's plan for Plymouth also a good example of colour, the blue c sea being reminiscent of the old maps o walls of the Vatican. Mr. Barry Pa model of Oporto, too, was an example of a model should be.



In Eastern cities the plans of Jerusalem Alexandria showed that the modern wa city improvement had reached even ancient cities, and both of these were str to emulate the Western cities in foresigh the future.

There are cases where one feels that the stones of these old cities are too precious touched, and in the case of Jerusalem, at rate, we may well hope that it will be ma long year before such sacred spots as the M of Olives are touched by the town pla Of modern cities in the East, none is develo more rapidly than Bombay. The great being carried out by the Bombay Develop Department was well illustrated by the r of the Back Bay reclamation works at pr in progress.

Under the head of Road Forms, cross sec of new streets showed what Manchester Birmingham, Leeds and Glasgow were d and in this section, too, the Ministry of T port showed in the London and Southend what great advantage an aeroplane survey give in expeditious working. In this cas the aid of aerial photographs, a great sc of relief work was put in hand weeks, i months, before it could have been read any other means.

The parking of motor cars in public street garages in all our great cities is a subject w will require a great deal of thought and atte and the students, both of the A.A. and London University Atelier, are to be cong lated on the way in which they have ta this new problem. The schools have be friendly rivalry in suggesting the lines on w wholesale accommodation can be provided the thousands of motors which are coming are now almost on top of us. The cars s into the huge garage, unload at the wa platform, and then proceed to park diago within easy call when required. Several o schemes illustrated showed great skill in planning and arrangement of these huge gar and the sketch elevations showed that even something new in the elevations of our streets was distinctly possible.

If ever, and whenever, aerial traffic bec general we shall completely revise all ideas of what a town ought to be. W the lifetime of the present generation will inevitably be vast changes.

Sketch showing necessity for preservation of trees on Arterial Roads.
By MR. ERNEST HERBERT.

Bombay—Portion of Model.

such a prospect, the preservation of the urches and their spires takes on an even nperative aspect.

l filling stations are becoming a wayside long the outlets from most of our large and it is to the credit of the various oil ies that these are in many cases very both in their design and layout. With e changes in our towns and in our sides the necessity for rigidly excluding sary advertisements and at the same eserving our beautiful country lanes and daily more apparent. A very telling by Mr. Herbert showed the wayside f trees, and what only too often happens nen the new arterial road comes along. nedy, though, is clear, and it cannot be ongly emphasised that trees once cut annot be replaced in the lifetime of this on.

have even now at least one Com- hard at work for the preservation ide greens and trees along such roads as ghton-road, and tree conservation is national service in more ways than one. ork of the London Society was well illus- at Olympia by a fine series of maps; y the most interesting and of most interest being the zoning maps of the Metropolitan boroughs, showing the of the industries and residential quarters. ese maps, one fact that emerged most was the enormous number and area of upied by public institutions in our slum . It looked from these maps quite clear vould be cheaper to the community, as a o have more open space for everybody, plenty of fresh air for healthy life vention of disease and crime, and avoid essity for curative institutions and of every description.

Herbert's ingenious model of Charing ridge has already been illustrated, and me is one which, in the light of events, nd to take even more definite shape ear future.

the section dealing with City develop- number of Scandinavian towns, par- in Sweden, showed what could be done enlightened public authority. Housing were illustrated by the L.C.C. estates ntree and Bellingham and elsewhere, as number of provincial housing schemes. Alwyn Lloyd's picturesque housing in South Wales were among the most ng of those exhibited. The Garden d Town-Planning Association also had esting series of plans, showing the of the garden city idea, or rather of self-contained towns as opposed to the extending our overgrown existing towns. w American city plans were given, phia being a typical example. r the chessboard plan has been adopted, he entire effort of all subsequent town- has perforce to be directed to the pro- one or more diagonal roads or avenues, n one appreciates the cost of such a e as that involved in the construction Fairmount Parkway, in Philadelphia, ises that one such "improvement" t as much as one generation can The checker-board plan is all right for the first small area, but when the city gets above a certain size, it costs in hard cash a good deal more than it is worth. Interesting French examples of town planning were shown from Belfort and St. Raphael, as well as the extension of the city of Paris and the reconstruction of Reims; but one may well quibble at the arrangement of an exhibition that puts under the head of *La Renaissance des Cités*, such diverse subjects as Birmingham—scheme for congested area; and Bath—aerial photograph of Royal-crescent.

Mr. Mawson exhibited a number of magnificently produced plans, one of the most attractive being his plan and perspective of the suggested developments for Blackpool, as well as a large number of parks and playgrounds.

Mr. Jas. Thomson's plans for Dundee, too, were examples of what an enlightened city can do under efficient leadership.

A number of regional planning schemes were shown, and it is satisfactory to note that at present there are no less than eighteen of these regional committees at work in various parts of the country. If they are to do real work, though, it will be necessary to see that they are put upon a statutory basis and not left merely as advisory bodies to their constituent councils. Power to act and act promptly in the public interest is essential. and it is not too much to say that the whole development of the country in the next twenty years or so will depend upon the boldness of the conception of our present regional and town planners.

Architectural Sketches.

It has from time to time been assumed that the camera is responsible for a general decline in architectural draughtsmanship; a decline both in quality and in quantity. And there may, indeed, be some ground for such an assumption. The camera, for example, has well-nigh supplanted the pen and the pencil as a medium for illustrating buildings in books and journals. The camera is one of those appliances which, like the railway, the motor-car, the aeroplane, the telephone, or the broadcaster, lengthens life by enabling more to be achieved in a given time, and as we, therefore, cannot neglect it, it behoves us to use it to the best advantage; but however employed, it cannot wholly supplant the practise of architectural draughtsmanship except to the ultimate detriment of architecture.

First, the camera cannot give that accurate record of an existing building which is only to be obtained from the measured record, and, second, the camera cannot enable the student to *learn* great buildings, for this process needs prolonged personal contact and contemplation, such as is obtained only by sketching and measuring.

To those who imagine that there is a decline in the quality of contemporary architectural draughtsmanship, we would recommend the first part of the new volume of "The Architectural Sketch Book."* We are particularly glad to see the inclusion of so many Gothic examples. It shows that there are still young men who rise superior to any prevailing fashion to despise what is perhaps the grandest mode of vernacular building; it shows, too, that study and intimacy with the building is considered of greater importance than the production of drawings for, time for time and labour for labour, a great many sheets of classic detail could be exchanged for the one beautiful drawing of the screen at Southwold Church, by Mr. Philip Hepworth, or for the three sheets of Elgin Cathedral, by Mr. Gordon Holt.

The number of contributors to the sketch book is small, and most of the drawings are the work of three or four men. Considering that this is the first appearance of the publication since the war, the choice of material must have been unusually great; it would, therefore, seem to be unfortunate that the collection of plates is not more representative of the Architectural Association. Geographically there is a wide range covering England, Scotland, France, Italy and Belgium. Let us hope that a greater selection of names will appear in the second instalment of the book, while still maintaining that same high quality of work which has distinguished the sketch book since its inception in 1867.

*"The Architectural Sketch Book." Volume 1923. Part I. Edited and published by the Architectural Association, 34–35, Bedford-square, W.C.1.

British Officers' Quarters, Meerut, India.

This building has been erected in Meerut for the accommodation of single officers. The scheme consists of two blocks of single-story buildings similar to the illustration; each block provides eight quarters, comprising bed-sitting-room, dressing-room, and bathrooms, with small stores for each quarter in the end verandah.

The total cost of the two blocks amounted to Rs. 189,351 (£12,623). It was found that the cost of the building was reduced by constructing two single-story blocks, instead of one double-story block.

The design for the building was prepared by Mr. B. Matthews, F.R.I.B.A., Consulting Architect for Military Works in India.

Officers' Hostel, Lahore, India.

This hostel has recently been erected for the accommodation of British officers and their families stationed at Lahore. It comprises thirty-two unit suites of rooms each containing bedroom, dressing room and bath room. The quarters are built in two double-story blocks on each side of the public rooms as shown on the block plan. The walls are constructed of brick, which is plastered externally on the first floor. The main and verandah roofs are covered with Allahabad pattern tiling. Electric lights and fans have been fitted in all rooms.

The architect is Mr. B. Matthews, F.R.I.B.A.

ARCHITECTS AND ADVERTISING.

R. D. ROBSON, of Barrasford, Northumber-, writes :—

—I read, with some interest, Mr. Overy's r appearing in a recent number of *The ler*, and although we may probably differ tail, I am (from experience) in complete d with the substance of his remarks. I ld like it to be quite clear that I take ontention to be "that the present unfor- te state of the profession, where the alified man can and does abuse the title tect whilst the qualified gentleman, or is pushed into the background, is remedi- and remediable by architects themselves." is well to bear in mind that for the majority e profession the æsthetic point of view is lled by the more mundane one of "bread butter"; and, as they cannot all be ged with monumental buildings, so they rce turn to the smaller things, for every needs a building for his home, and, to a extent, for his business and his recreations. nan can say that an architect is less an tect because his first consideration must be earn a living"—architectural ability ot, thank God, be bought with money!

l round us we see, glaringly, the hand of harlatan in architecture: in the absence of planning, haphazard lay-outs, and build- without any merit except that the walls se a space and support a roof. One has to study the reports of "plans passed" by local council to notice that builders— of them good and efficient men as lers—are responsible for the majority. I urther. I have noticed plans of some itude having been submitted by persons in my opinion, possessed no other know- but a smattering of construction, it evi- ly being up to the contractor to surmount all ulties himself as the work proceeded. In all ases I have in mind I believe the people who ucted these men were under the honest ession that they had secured the best advice course they had (if one asked them), or why the assignee designated himself far and as an "architect"? But who is to blame? "man in the street" (always the potential t) associates architecture and the architect great buildings and schemes costing nes, for it is only in this connection, *via* daily press, that he ever hears of the tect's existence.

e other day a gentleman, desirous of ng a wing to his house, consulted first, in three small country builders, and was recommended by one to consult me. I for certain reasons, unable to undertake work; but it appeared that the reason I consulted was that none of them could are a plan, and were quite incapable of g a price without one (leaving aside other alities). I shudder to think of what might e happened to a fine old house had one of n made bold and shouldered the respon- ity. I know them all well.

Again, a gentleman of my acquaintance constructing a cinema had, so he casually told me, some difficulty in finding a qualified architect in the neighbourhood as he was not acquainted with the methods of "digging out these retiring birds." I may add that he was candid enough to tell me that the need for an architect only arose when he discovered that the combined architecture of himself and his builder was not the architecture that had fired his imagination; and, incidentally, that the letter of the law had been somewhat overlooked.

Another gentleman (an influential person) of my acquaintance desired to add to his factory; his builder copied what existed. The gentleman now proudly claims to have saved a heavy overhead charge in the architect's fee. He has saved a little, but I never hear of him proudly boasting of the result.

Now, I ask, why does the architect not tell his fellow men what he is and what he stands for, and that architecture is not necessarily big building or an overhead charge (it may be a considerable saving) for, at the moment, that is only obvious by reading the technical press, which the layman has not the time or inclination to do. I feel that architects are too far away from their fellow-men; they must get nearer to them, and the only means open as far as I can see is advertising. (Yes, there is protection, when architects would have to be consulted, but the great ideal of this is evidently now subservient to a detail.) It is but folly to sit still and plead æsthetics (admirable as they may be) as justification to an unheeding world.

I remember some time ago a gentleman writing in a contemporary technical journal that he abhorred the idea of, and the blatancy of, advertising; it was reducing art to commercialism. There is advertising and advertising, but the English Dictionary only contains one word for all degrees. It is one thing to tell your fellow-beings how your particular knowledge and capabilities will benefit them (and if you are possessed of such attributes it is, I consider, a moral duty to do so), and quite another to announce far and wide, from the hoarding, the papers, &c., that one's cure for bleak landscapes, ugly vistas, and the misuse of materials is the "real goods." But no architect would do that; rather let him be permitted to state simply that he is an architect, where he is to be found (few laymen possess directories, and fewer still know where to find them), and possibly with a list of his works, so that the layman may go, see and judge. This I would advocate only in selected and approved newspapers and periodicals.

In these controversies one is invariably met with the so-called parallel of the doctor. There is an affinity—both are professional—but there is no parallel. The doctor is protected, architects are not, and the doctor deals direct with his client. With the architect there is an intermediary—the contractor or craftsman, without whom the architect cannot function.

Capable men are turning away from dire necessity from the profession—it is overcrowded. But I firmly believe there would be no overcrowding if architects were consulted in only 50 per cent. of the building work undertaken and in which they ought, undoubtedly, to be consulted.

I agree with Mr. Overy that it is hard to read newspaper advertisements with "architect" tagged on to a host of other occupations and not to know that the gentleman so designated has but a scanty claim, if any at all, to the appellation. But—and this is serious—the gentleman of the multifarious service is probably the man consulted by the layman; the result, in the majority of cases, is deplorable and as a consequence derogatory to the profession as a whole.

Some of your readers will hold other views, and I hope this matter will be thoroughly ventilated—it seems to me to be of paramount importance—so that we may arrive at some standpoint as to where the majority of the profession feel they do stand.

HENDON URBAN DISTRICT COUNCIL HOUSING SCHEME.

THE Hendon District Council have carried out housing schemes in Central Hendon and also in the Child's Hill Ward, which adjoins the Hampstead boundary.

The Brent Hill scheme (consisting of 244 houses) has been carried out partly by the Improved Concrete Construction Co., Ltd., and partly by Messrs. J. E. Billings, of Oxford; Messrs. Perry & Co., of Ealing, W., being at present engaged on a further twenty houses. The greater number of the houses are of concrete construction, the walls having a cavity and rough-cast externally, with brick plinths, strings, chimneys and dressings; others being built of brickwork rough-casted. A considerable number of designs have been provided in order to avoid monotony, and further variety has been gained by the introduction of tile-hanging, varying the details of the chimneys, &c.

The Child's Hill scheme is a continuation of the former Council group of cottages carried out from the designs of the same architect in 1914–15, the construction throughout being brick, rough-cast; and the contractor for the whole group was Mr. Geo. Ramsbotham, of Hendon.

We understand that these Hendon houses have the distinction of being the only plans which were not cut down by the Ministry of Health. Winding steps are avoided in all but one of the many types, and bay windows are introduced; even porches in several instances were allowed to remain.

Mr. W. Hughes acted as clerk of works for both schemes, with Mr. F. Bush as assistant clerk of works. The architect for both lay-outs and for the whole of the houses was Mr. George Hornblower, F.R.I.B.A., of 2, Devonshire-terrace, Portland-place, W.

Hendon Urban District Council Housing Scheme: Brent Hill Site. MR. GEORGE HORNBLOWER, F.R.I.B.A., Architect.

THE BUILDING ART: THEORIES AND DISCUSSIONS.—XII.

By W. R. LETHABY.

WORDS OR REALITIES? AND POSITIVE ARCHITECTURE.

It is a matter of observation that the introduction of antique ornamental features goes with a decline in constructive power.—PROFESSOR J. STRZYGOWSKI.

THE quotation above, taken from a new book on the Origins of Christian Church Art, which I have been reading, is obviously true. The mind must be set on the things that are in front or on those behind. We must either be pressing on or slipping back—positive or negative.

I doubt if much can be done if it is merely left to our wills and intelligence, the powers of the "world" are so very strong; but it is our duty to try and every trying makes some difference. We must, in fact, in the larger measures of things, either develop or decay, but I know these larger considerations are rather remote, and there always seems a chance for us individually in some competition scramble. But if we could only divert our gaze from paper palaces and turn towards realities, following the way of experimental, economic, and manly building, in trying to work out reasonable schools, houses, and butchers' shops—the common problems of daily life—we should reach quite quickly a *Positive Architecture* not only fit and proper to our age, but one we could understand and discuss with others without the mystery voice. It would be good for us as well as for society. "Architecture" at least builds architects.

It is an absurd tragedy how we have been misled by the novelette view of "architecture" and other grand words, to which we won't take the trouble to fit meanings: Art, architect, design, originality, style, proportion. It does not matter a bit if we call *truth*, "verity"; or if we call *firmness*, "stability"; but it has mattered much that we have divided *work* from "art," and *building* from "architecture." Owing to our way of double-dealing with very slippery words it is now very difficult indeed to get a thought passed from mind to mind. Unless the wireless is properly tuned, we don't get the message, and we can only see things from our own window.

"Physical Energy."
By the late G. F. WATTS, R.A.

Our phrase, "a work of art," is an unfortunate duplication, but even as it is it should at least mean a work of workmanship. In any case, we have little reason to bother and confuse ourselves about architectural works of art. What works worthy of the name and proper meaning have been produced in England during the later centuries? St. Paul's, we may readily grant, is such a work; it is a monument of its age, the life work of a great Englishman, and in it are associated many fine forms of workmanship. Then there is Stevens's Wellington Monument, which, indeed, is throughout a work of workmanship. Thirdly, there is Watts's "Physical Energy," in Kensington Gardens. Further, there are a dozen or two productions, like Somerset House, the Oxford Rotunda, &c., which may be allowed to pass in a secondary class; but there is little else in the way of building or monumental art to worry ourselves over. I cannot think that any well-known building erected in England within the last hundred years should count as a work of art.

"Architecture" is a pretentious parasite word that has settled down on *building* and eaten the strength out of it. There is something so "grand like" in spelling over the word, a-r-c-h-i-t-e-c-t-u-r-e, explaining about its being the king and queen, master and mistress of the arts, and in reading æsthetic disquisitions, that it strongly appeals to our weakness—especially in youth—and turns our heads, so that thereafter it is difficult to see straight. When the New Testament was put into English the word architect was translated "Master-builder." "Design" has so separated itself from *doing*, of which it is properly an essential part, that a large sphere of *designing activity* has almost completely detached itself from *building experience*. Ateliers work with books of examples of periods, features, and styles. On this supervenes and flourishes draughtsmanship in composition of style-features, leading up to brilliant prize draughtsmanship in the re-composition of dead and decadent features (composition of decomposition). Then the system is rounded off in competitions of the double extra expert style draughtsmen, adjudicated according to professional racing rules. Last of all come the poor buildings. The beginning of building wisdom is the sense of weight and responsibility: paper designing necessarily runs to the light and flighty.

Again consider the word *style*, what we mean and what we might mean by it. Our rough first notion, I suppose, would be something like this—"the characteristic appearance of any thing or group." I look into Skeat and find that its probable derivation is from *stilus*, a writing instrument, and hence it comes to mean a manner of writing or doing other things. In a French dictionary the meaning as used in the arts is given as—"Manner, particular to an artist, to a kind, or to an epoch." That is admirably concise and clear for the descriptive meaning; but it does not touch the differences between good and bad style, and what we should aim at in our own efforts. Take an example from literature: there is the style of Wordsworth, in the technical and descriptive sense, and there is his style in the general, human and positive sense, his thought, his aim, temper and meaning. Now I want to suggest that we need to understand that building and any other form of art exhibits style—good or bad in this larger sense. Style of this kind we might define as *expression of the content*, for every thought and thing that goes into the production of a work of art will in some way tell in its expression just as faces come to paint minds. I won't speak of

"Physical Energy."
By the late G. F. WATTS, R.A.

deeper things, but only of commonplace: think, however, that the style of any time country is shown by reality and soundness, fairness and finish, by organic structure; by tawdry make-believe and sullen gloo The style problem to us is what may be put in our works of sense and serviceableness and th the expression will take care of itself. Se reality, not the "look" of expressing expressio It is reality which makes the style to all w can read it. I must not speak of nobilit intellect, courage, and other high aims; but may say that mere common sense followed f a year or two would make a common-sense styl The only style question that matters is: Wh is in a work?

A word good enough in itself has been qui spoilt in its recent use; this is *compositio* All planning and fitting together is compositio but the idea has been destructively presse that there are specially "art forms" of "co position" going beyond general ideas of ord efficiency and tidyness. It is not so, and such notions stand in the way of true a expressive composition. A ship or motor-c are wonderfully composed—everything is rig balanced, and in order; but preconceived ide of "art" composition would only have preve ted the finding of right solutions. Now th in New York the necessities of getting lig down into the street has resulted in the pushi back of the upper stories of their tall buildings a common sense structural arrangement—" are rushing to copy the look of it, at quart scale, as "style, composition, and massing"

Among the most betraying words "ornament" and "decoration"; being usel and generally worse than useless we concentr enormous attention on them. "Ornament" the main arises in three ways: primarily magic marks to ward off evil, secondly in luxu and lastly in workmanship. This last is t permanent and universal source. In all fu tions well fulfilled there is likely to be a lit extra thrown in for fun. If you take a dog a walk he does a bit in excess to show that likes it. Children give a skip and a jump. cook adds a few touches to the pie-crust. workman, free of his job, cannot help, especia near the end, giving a turn to his tool. C modern ornaments are like the smiles of childr who have been warned that they will be flogg if they don't skip. The "look" of joy workmanship imposed from above is an impo tion, indeed.

Mechanical structures have the interest a even the *mystery* of their reality and necessit they reveal the very nature of things. I mechanical ornament is a contradiction axioms and definitions; it is a gratuit addition of labour and sorrow—a sham anc shame.

Tradition is often used in our ambiguous a indeed, upside-down art language, as if might resume it at will at any point we for t moment like. I remember seeing in so "advice" to students on the way in wh

y might "treat their designs," it was gested that the "treatment" might be dern or traditional, as if *our* tradition could anything else than modern. In a notice in "*Revue des Deux Mondes*" (Nov., 1922) a new account of French art, by Louis Gillet, ng part of a general "History of France," noticed these admirable remarks: "His pose is to bring out the national tradition. s strangely abused word he uses in its itable sense. Tradition is not that which one epts from the past, it is a legacy which, in te of one's self, runs in the blood. It is edity which may not be denied or eluded, s the race, the temperament, the continuity ife itself." That is tradition, indeed; its very nce is that it is exercised spontaneously. Then there is a class of words like utility, struction, and building, which we are ays interpreting in a negative rather than positive sense, as if we said a *mere* utility, r construction, *mean* building. I have often d "mechanical" in that sense myself, this use of words may betray one. A fect loaf of bread, or ship, or roof (if we ld only find out how to make one), would be tility; but it would be absurd to prefix the d "mere" or "poor" to our thought . Mechanisms themselves, so far as they are and serviceable, are vehicles of spirit and oetry. The Forth Bridge has qualities of er and adventure which might well make it bject for a poem by Mr. Masefield. Compare styleful recent building which comes into r mind; could anyone write a poem on that, pt in the key of pathos? It is only by ity we can hope to get back the poetry in buildings, so that the mention of them may d like bridge, barn, sheaf, rick, plough, e, balance, loaf, cradle, mirror, anchor, , wagon, engine, crane, clock. Nothing is g with worthy mechanism.

here is a quite modern word which I should to consider: this is "standardisation." modest and distinguished architect of the building some time ago said that works more standardised in America than in and. Now here is that valuable thing, an ; what shall we make of it? It occurs to hat there may be two ways of thinking t it; to suppose straight off that it means ng out tens of thousands of buildings, ned in a Government office, all exactly alike, bad at that; or to understand it to mean development of types, the drawing away waste and anarchy in production, and the pt to reach real and rational solutions. e latter sense, I am all for standardisation. ping by types seems to be in the very nature ings. A dozen examples might be given, will mention only the old traditional art ip building. One might have thought that would be a steady gradation of change a small boat to the biggest ship, but and sails ruled that ships should be d into groups—the smack, brig, barque, &c.—and gradually in the search for per- n every detail became "standardised." ed something of the sort for our buildings; the grouping; and then the detailed opment of reasonable working parts, fireplaces, windows. How do we "de- a house now? Almost as if one had been built before; in any case, there is ge body of experience readily available; ecessary services, like heating, water and supply, are ever fresh surprises, and every ect feels that he must "design" any details," like doors, stairs, and chimney- , all over again, even to the "mouldings." asier, indeed, to draw new "profiles" on etail" for the hundredth time than to rdise office procedure.

re follow need and reason, there should be r of dreary monotony, differences of site, dual requirement, and development will and give all necessary variation. The idea of standardising suggests low level ; the right manner of seeking to stan- e—it is no paradox to say—brings about ing movement by experiments to make t. Without the standardising aim we are er subject to whims and casting back on our track; with it, we might hope to bring some order out of the present chaos of anarchy, whim, and vulgarity. These examples of "architecture" in the whim and seem-so styles, which we are so excited in getting designed and then executed—poor things—in days of stress have something portentous about them; there is invisble writing on their walls.

There is amazing ability amongst our architects, and that makes the present scattering and squandering of effort all the sadder. It must be said firmly that while they continue to "design architecture" according to "taste in the styles" they are building not only on sand, but with it. It cannot be done; the better it seems for a moment the worse it is in fact, for only reality counts in such arts as agriculture, building, navigation and the rest of the great human occupations. I visited the recent exhibition of photographs and models at Grosvenor House and wondered at the perfection to which certain kinds of *seeming so* had been brought. The show would have delighted me beyond estimate when I was about seventeen and thought as a child. There was just the right look of this and that—"Country Life"-ness, simple workmanship, poetry, innocence, accident, and age. All the "effects" were laid on with exquisite tact and cunning on these ancestral looking houses for the newest rich; but I felt in my heart that such confections were not natural and real enough to last.

While we aim at being in any style or manner the result must *necessarily* be a sham, or second-hand, thin and poor. Greek, Gothic, Renaissance, the picturesque, the grand manner, and the Beaux-Arts manner are only names and limitations. In place of these appearances and flavours, the smell of art, we must learn to see our projects and buildings through positive facts and stern conditions. We need to have education and thought founded on a positive method of design and appreciation—something of the kind which may be suggested by the classification which follows.

Structural mathematics, geometry, and mechanics; common needs and planning; materials and workmanship; living experience of the working and use of stone, wood, brick, iron, plaster, &c.; local building custom and recipes; constructive factors, walls, piers, floors, roofs, arches, domes, vaults, buttresses, windows, skylights, staircases, chimneys, &c.; organic arrangement and appreciation of weight; balance and stability in the arrangement of parts or cells, and efficiency in services; common conditions and circumstances, neighbourhood, site, sun, aspect, air, dryness, durability; lighting, warming, sanitation, economy; ease of access for repair and cleaning; labour-saving in maintenance (very important); types and species, public buildings, houses, shops, &c.; order, compactness, intelligibility; finishing and furniture, employment of contributory arts, painting, sculpture and other forms of free workmanship; combinations and lay-out; contact and agreement with builders, engineers and craftsmen; experiment, development, invention. Our aim in three words is nothing less than *perfection in building*, the development of a positive Architecture.

Having in mind the fact that we can neither go back nor stay where we are, I will put down in briefest manner what I suppose should be our immediate aims.

The individual student should make up his mind what sort of "architecture" he intends to pursue—realising, of course, that ordinary work is necessarily of an average kind and not all palaces in the air or casinos on a lake. Will he concentrate on the lively and really romantic art of building, or on the flash fashion-plate sort of "architectural design"? Every student must try to form some general thought of purpose as a "perch to his mind," and not be swept along unreflecting into the advertising demi-monde view of "architecture." The problem of architecture as it should be presented to the student's ambition is how to build rainproof, cold-proof, folly-proof shelters.

The schools should turn towards facts, common sense, common service, and structural science and drop the "æsthetic" rhetoric utterly. Such doctrines are hardly now tolerated even in schools of "Fine Art," save in the architectural departments. In such schools they try to teach how to paint and how to model and there is little style talk laid on. So in a school of "architecture" the students should be taught what is known of how to make good buildings and not how they are to slime them over with style "looks."

Best of all, I should like co-education with builders, engineers, and craftsmen up to a point, so that a youth would form contact with other workers in the same cause and have some choice as to which path would suit him best. It may be attempted to make up for lack of practical knowledge in the schools by adding classes to show what work is like. Such showing what things are "like" instead of what they *are* in the real world, is dangerous and only increases the area of the abstract and unapplied. It could not be in such facts as digging foundations and putting in concrete, but might be in the modelling of "swags" and carving of "eggs and tongues."

Architectural societies should develop in the direction of the guilds; and have the common average good in view rather than the flotation of eminence. They should make themselves centres of research, experiment and record, and work towards the bettering of the great wide-spread mass of common building. Above all, they should cease to recognise and adjudicate on competitions for buildings. The very first purpose of a guild is to protect the members from bidding against one another; that it should be accepted as a regular institution together with fees for adjudication seems to me intolerable. Apart from the waste, these competitions encourage the idea that design for building is the preparation of taking—or "taking in"—drawings; an idea that has deeply saturated the thought of employing people. The training of the schools in the prize draughtsmanship of styles works in with the system and piles up a vast burden of waste labour on waste paper. The typical modern institution seems to be the waste-paper basket!

With this part I end these discussions. My theory of "architecture," such as it is, has not hastily been formed in some eddy of reaction. Looking back, I see that I have always held such views since the first days of disappointment, when I discovered the difference between old building realities and modern whims in the draughtsman styles. I have not been complaining, I have been less concerned with what is than with what will be. It is the future that matters. Directly we transfer our interest from the vague superstitions about "architecture, styles, and proportions," to a developing art of building we shall begin to have a positive Architecture once more. The very centre of our art is construction, clear and clean, vigorous, close-knit, and high-strung. When it is organic it will also be harmonic. I end with six key words: service, structure, economy, experiment, development, invention. But even this is too long, and I reduce it to service and structure.

An Exhibition of Architecture.

The Royal Institute of British Architects have been invited to arrange an Exhibition of Architecture in the Palace of Arts at Wembley. The Exhibition of Architecture will open on May 19, and will close on June 28, 1924, and will consist of a representative selection of the recent work of living architects in the United Kingdom, India, the Dominions and Colonies. It is proposed that photographs and models only shall be exhibited. The Exhibition will be of a general nature, except that Town-Planning and Housing Schemes will be excluded in view of the fact that a Town-Planning Exhibition is to be held immediately before the Exhibition of Architecture. The arrangements are being carried out by the R.I.B.A. Exhibition Committee, with the assistance of the Architecture Club. Owing to the limited space at their disposal and to the necessity for the display of representative work from the whole Empire, the Committee propose that the Exhibition shall be arranged by invitation only.

BOOK REVIEW.

Economics of the Hour. By John St. Loe Strachey. (London: Hodder & Stoughton.) Price 7s. 6d. net.

We do not suppose Mr. Strachey would put forward a claim to be considered a professional political economist, and probably this is one reason (out of many) why we like his book so much. The many academic books which have been written since the war have thrown so little light upon our economic problems that Mr. Strachey's book—written, as we imagine it, from the layman's point of view—should appeal to a wide public. The outstanding features in this book, to us, are its common sense, breadth of view, and, generally speaking, the soundness of the conclusions arrived at, even though all are not likely to agree with it in various details. Mr. Strachey's writing is simple and direct; he advocates with force and sincerity, and hits hard and clean. There is nothing timid about this book, which states many things which badly need stating at a time when industrial depression is acute, when every form of half truth and paradox has been eagerly fostered. It is a wholesome tonic to read a work of this nature which contains an economic philosophy dealing with broad principles.

Among many excellent points we draw attention to the following: "The real worth of anything is just as much as it will bring; the disastrous policy of limiting supply in order to endow an object with value; the perverted reasoning which makes one man shout for a limitation of supply while the other voice is shouting for plenty and low prices; the fact that it is never true that a fixed quantity of anything and no more is wanted; directly the price is greatly reduced the demand and the consumption increase; the great increase in labour-saving machinery, which, instead of employing fewer men, employs more men; the fact that the use of labour-saving machinery never injures the workman, but, on the contrary, improves his conditions; that trade unions, if they did not exist, would have to be invented in order to increase the power and dignity of labour, but that they cannot in the long run increase the remuneration of labour, for that is governed by external conditions outside their field of action."

The author pours ridicule upon "the industrial paradise where everybody may live in a splendid repose upon the idleness of everybody else." He points out that a man may some day realise that if he is a consumer in a hundred things and a producer in only one thing, it may be better worth his while to look after the keeping down of prices in the hundred things than in trying to raise them in one particular instance. Unfortunately we find that the man tries to do both at the same time and being unable to see the economic fallacy (of what is really a Gilbertian situation) each producer tries to keep up his own wages and prices. We see the humour in the remark of the Italian professor of political economy mentioned by the author, who is said at the end of a long life to have doubted whether the consumer really existed. The author does not say definitely that wages must come down, but that is the inference we gather from the book. "If every one wants more cake," he says, "a larger cake will have to be made. It is useless to argue about the division of the cake, for that is settled in the main on immutable principles."

In the chapter, "To Strike or Not to Strike," the author puts the whole position in a nutshell in the following passage: "After all, the men are partners with the masters, and what they want is not to injure the trade, but merely to get a different division of the total profits. To increase, then, the cost of production and so kill the demand first for the thing produced, and secondly for the labour of the producers, must in every case be an injury to the workmen who form the trade unions."

The working out of this division of profits in the chapter on "Dividing the Cake," reveals a mathematical solution which we believe has the approval of many sound economists. One could make a shrewd guess that the reason this recommendation has never been applied to solve our present difficulties is because it would be found that labour is receiving a bigger share than industry can provide.

On the principle that a burden is none the less a burden because it is imaginary, it may come as a relief to many to learn that the burden of war taxation is not so heavy as is generally believed. A large proportion of the cost of the war was paid year by year as the war went on; we lent money to ourselves and we are now paying income tax to pay ourselves dividends on our loans. The crushing taxation to which Mr. Strachey refers obviously applies to the spending departments of the Government, and not to the cost of the interest on internal loans.

Mr. Strachey contends that the rate of wages for labour engaged on work provided for unemployment should be less than the standard rate for legitimate economic work. The reasons he gives appear to us to be quite sound, but the most important one to us—which he does not mention—is the probability (and it may be a certainty) that by helping to maintain a wage basis higher than economic conditions warrant, we may be employing at one end and creating an equivalent of unemployment at the other.

We cannot, in the space at our command, refer to more than a few of the suggestive chapters in this book. It deserves the attention of every thinking person, and the author will have done a great service if he has succeeded in drawing attention to doctrines which have gone out of fashion as we acquired the habit of sinking our individualism and learning to lean more and more upon the Government for help.

Books Received.

Who's Who in Architecture. By Frederick Chatterton. A record of practising architects and their addresses, and in many cases an appended list of their works. (London: The Architectural Press). Price, 25s. net.

Islamic Architecture. By Sattar Kheri. (London: John Tiranti & Co.). Correct price is 3s.

THE SOCIETY OF ARCHITECTS.

We take the following notes from the minutes of the Society of Architects:—

Registration.—On the invitation of the Council of the R.I.B.A., the Council of the Society has appointed representatives to resume negotiations with members of the Institute Council on the subject of Registration. Conferences between the parties are proceeding.

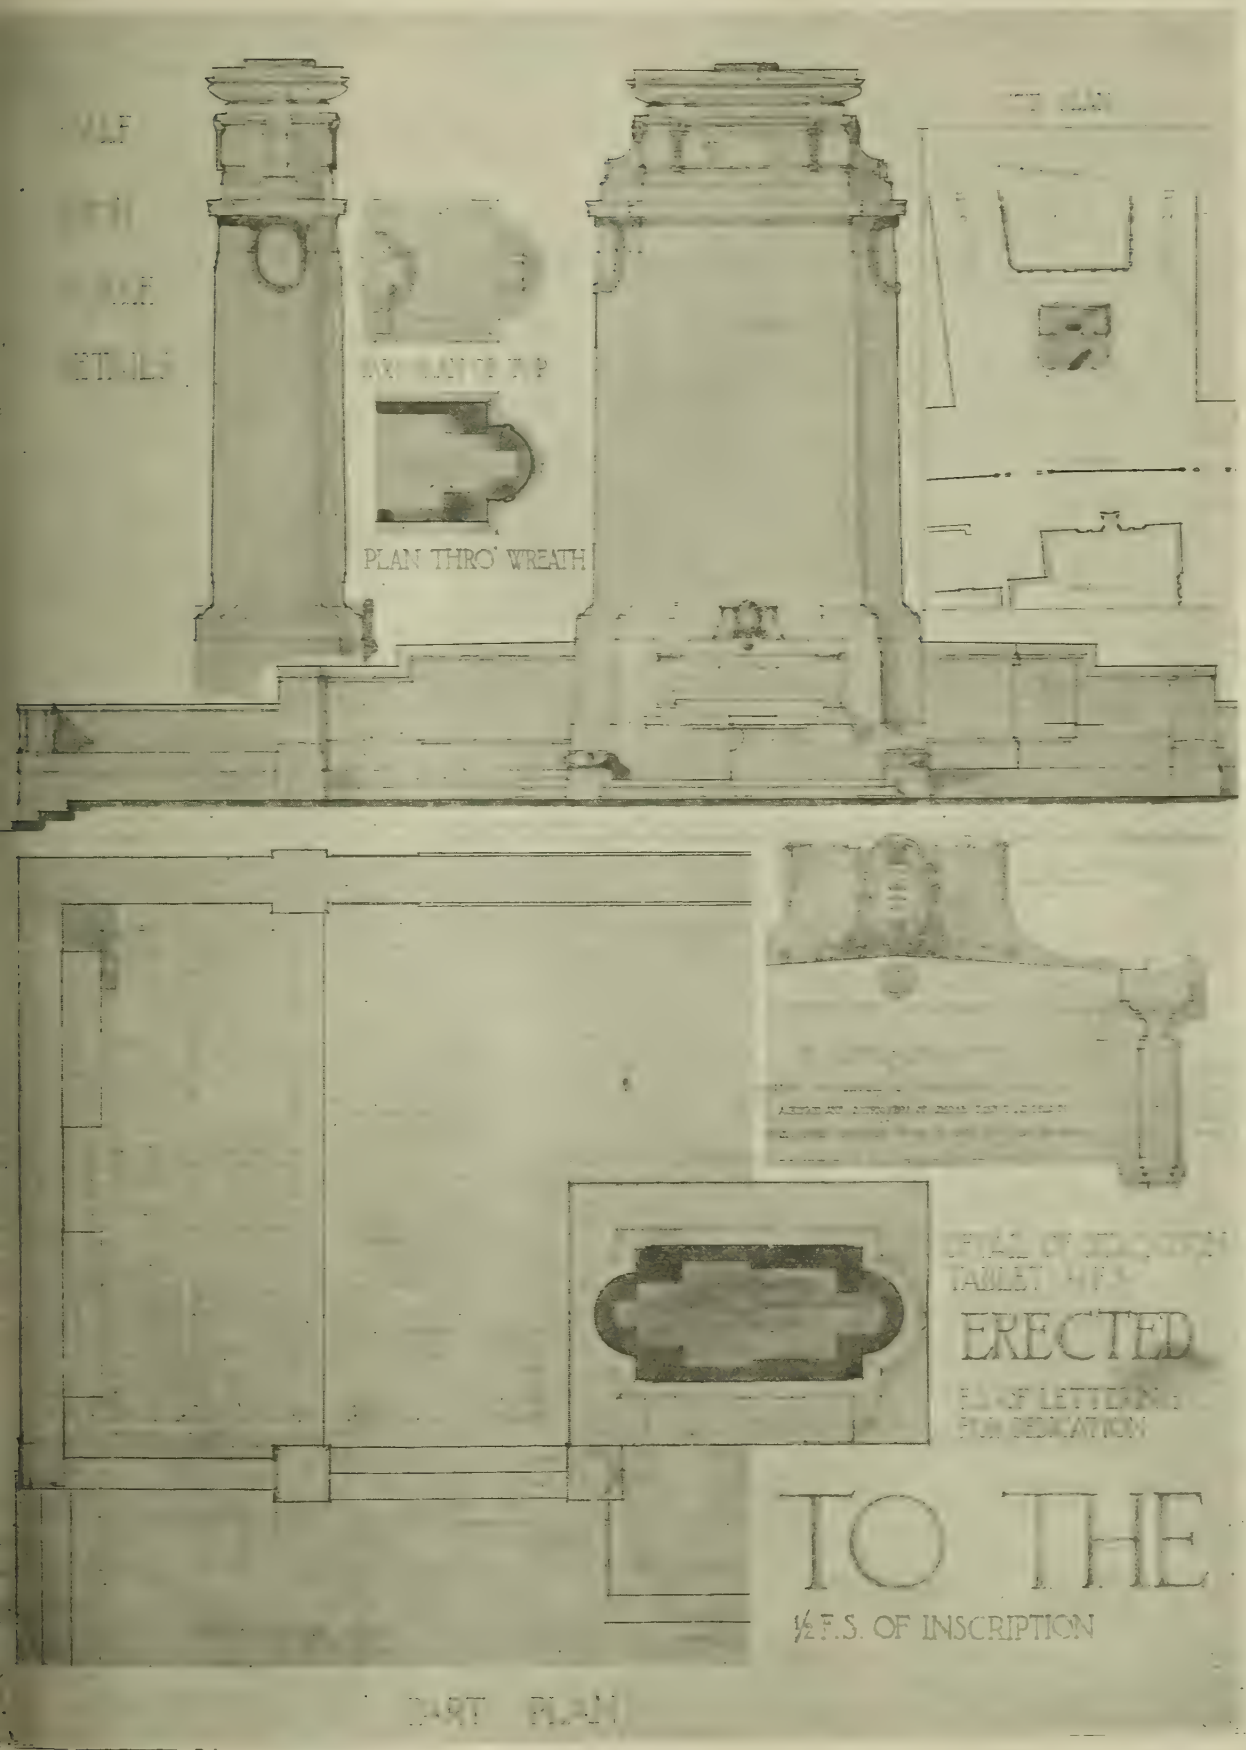
"*Architecture.*"—Developments are contemplated in this journal, which it is anticipated will still further increase its value and interest to all concerned. The Council has arranged to place the distribution and sales of the journal in the hands of a publisher.

Arbitration Tribunal.—The Council of the Society has appointed an Arbitration Committee available for reference to arbitration (*a*) by consent out of Court, and (*b*) by reference under an order of the Court, concerning matters in dispute affecting or connected with (1) the profession of architecture, and (2) the building and allied industries.

The Committee is constituted at present as follows: E. J. Partridge, P.S.A., F.S.I.; Major E. C. P. Monson, P.P.S.A., F.R.I.B.A., F.S.Arc.; E. J. Sadgrove, P.P.S.A., F.R.I.B.A., F.S.Arc.; A. J. Taylor, V.P.S.A., F.S.Arc. (Bath); and John Knight, M.S.A. (Manchester). The Registrar of the Committee is Major W. E. Watson, F.R.I.B.A., barrister-at-law.

Board of Professional Defence.—Major Ha Barnes, V.P.R.I.B.A., and Major W. E. Wats F.R.I.B.A., barrister-at-law, have accepted Council's invitation to serve on the Socie Board of Professional Defence.

Education.—As a result of reports and rec mendations received from various (C mittees dealing with educational matt the Council have made such revisions to Society's regulations relating to examinati scholarship competitions, and design cour as will increase their scope and privileges, remove restrictions other than those necess for their proper conduct, thus enabling then be carried on with greater benefit and adv tages to all concerned.



THE PRODUCTION O ART.

Though an important exhibition in its the occasion of the opening of the Aberd Artists' Society Exhibition was made usually so by the speech of Mr. Macgilliv LL.D., R.S.A. (His Majesty's Sculptor Scotland), who made a strong protest aga the usurpation of the "machine," and decla that the creative artist—the poet, pain sculptor and musician—was the last defende humanity against the ever-growing incubus machinery. He has much to say as to fostering of the art schools, from which quote the following:—

"What has happened since 1870? It wo take too long even to glance at anteceder Let us look at things as they are. Art is u the town—everybody knows her. Great su are spent by the nation on huge art school hot-house caravanserais, where all the arts crafts meet, and where emulation is und provoked by medals and money prizes; where, after a term of five years or so, diplom youngsters are turned out, who paint pict and model statues and busts almost by rec and often in a way so fair as to startle v likeness to the real thing; but, like the pluc poppy, they have only to be taken home fade for lack of that something of the Psy which holds indefinitely. Yes—art is upon town in an endless variety of manifestati from blatant posters to chocolate box It has become boring and, in some cases, nauseous as sugar would be if put into ev dish at mealtime. An eternal round of patiss as against sound bread and meat or plain ca and ale. I'm afraid I have little sympathy v the art school training for the arts we thinking of. In the days of the great on Pheidias and Apelles, Michael Angelo and Vinci, Rembrandt and Velasquez, Reynolds Raeburn, Turner and Constable, Rodin, Whis and Beardsley, there were no such caravanse as I have been tilting at.

"Art dealers—those immaculate expon of veracity—those money changers in vestibule of the temple, tell me that pict are as 'a drug in the market,' and that 'sc ture is an art without an audience!' and I obliged to believe them, because I know t must know, and because I believe, in the of pictures, anyhow, there cannot be in all wide world so many real artists as would all the exhibitions now in being, to say not of the tiresome thousands rejected by the w selecting committees, who, as the stream futilities pass, fasten upon a bit of the thing, as hungry men do on a morsel of f and, as I have seen, clap their hands with del over the finding.

"If it be true that works of art are to-d 'drug in the market,' the converse must that there is apathy among the people tow such manifestations, or that a flood of spurious has inundated the good, the true, the beautiful. 'In former times,' says Ra dranath Tagore, the Indian seer of the 'the intellectual and spiritual powers of earth upheld their dignity of independence were not giddily rocked on the tides of money market. But, as in the last fatal st of disease, this fatal influence of money has into our brain and affected our heart.'"

Hull Cenotaph Competition.

Second Premiated Design: By Messrs. H. G. Hall and R. G. Cox.

[The first premiated design in this competition, by Mr. F. H. Hughes, A.R.I.B.A., was given in our issue for August 31.]

TOWN PLANNING.

COLLABORATION BETWEEN ARCHITECT AND ENGINEER.

By T. W. MACALPINE.

In the leading countries of the world there is a steadily growing tendency to consider the welfare of the community as a whole rather than that of the individual citizen. One indication of this is to be seen in the increasing interest that is now shown in every branch of town planning, and even in small, as well as large, reconstructions and improvements in old towns. If this corporate effort is to develop all the possibilities in it, a closer collaboration between architect and engineer would appear to be a primary condition. A town is mainly the joint product of these two professions, and to obtain the highest results possible in the interests of the public they must work in practical sympathy.

All town developments can be comprehensively grouped under the following three heads:—

1. Small alterations and improvements within an existing town.
2. Extensive reconstruction in a section or sections of an existing town, or expansion in the suburbs.
3. The building of an entirely new and planned town on a selected rural area where the conditions are not appreciably hampered by older buildings.

As an example of the first, we may instance the changes that are continually taking place in, say, London, where old buildings occupying a relatively small area are demolished and the site covered by new buildings, or adapted to other purposes. In the case of the second, it is, perhaps, sufficient to point to the extensive reconstruction that has taken place in London on the area now covered by Kingsway and Aldwych and the adjoining streets, or to the recent growth of planned towns in the suburbs of London and in the Midlands.

The various town-planning schemes that have been engaging the attention of local authorities in this country provide an instance of the third.

But we can also consider the almost unlimited opportunities for both the selection and lay-out of new town sites that exist in the British Dominions and in several foreign countries. To-day, there are indications of a more rapid development of the great self-governing Dominions of the Empire, and this must furnish very many opportunities for almost ideal town planning during the next hundred years at least. The conditions under group (1) above are very circumscribed, and they provide at most a somewhat limited opening for collaboration between architect and engineer, and the same remark applies even to such extensive developments as those which have taken place in the Kingsway and Aldwych area. But when we consider the extensive expansion in the outer suburbs of towns and cities, and more especially, the conditions noted in (3), the opportunities for beneficial collaboration are practically unlimited.

In every town the street and road system is, of course, the groundwork of the whole plan, and the general convenience, amenities and picturesque appearance of the town depend, in the first place, on the system of roads and ground contours. While the planning of the street and road system, squares, public gardens, parks, houses, shops, offices, public buildings, etc., should be essentially the work of the architect, it is necessary to bear in mind that the engineer must carry out the actual construction of these streets and roads. Moreover, one or other branch of the engineering side will proceed to lay tramway rails and erect standards to carry the overhead trolley wire system, telephone and telegraph posts and wires, and street lamp standards.

It is clear that the tramway system, in so far as power costs for operation are concerned, can be much influenced by ground contours and street gradients and, hence, by the architect's town planning. The overhead trolley system has now been found to be superior to all other forms of electric traction on public roads, and it is practically certain to be installed in preponderating degree wherever street tramways are required. But there is not sufficient reason against running telephone and telegraph wires and cables underground in towns, especially when new roads are being constructed. It is true that the first cost of underground lines is somewhat greater than for overhead wires, but it has many advantages in practice, which, in the long run, go far to neutralise this greater outlay. If this practice could be followed generally, one of the unsightly features of our towns would be finally eliminated.

Again, the architect, enthusiastic for the æsthetics of his town plan, has surely a right to expect that he shall be consulted in regard to the design and location of those other street features—the street lamps and tramway standards. It also falls to the lot of the engineer to design and construct the bridges (steel, stone, brick or reinforced concrete) which carry railways, roads, canals, water and sewage conduit pipes, through towns.

While the engineer must design these structures to meet the required conditions, there is everything to be gained by entrusting to the architect the decorative treatment of the approaches, roads, parapets, and all exterior surfaces of the bridges. In accordance with present-day opinion the architect should be empowered, when preparing the town plan, to allocate the area or areas for public works (electric power stations, gas, water, and sewage works) and factories. But he should also be consulted in regard to the buildings and other structures comprised in these works, etc., so that the amenities of the district need not suffer as they have done in the cases of very many towns in this country.

It is generally possible to allot space adequate for the development for many years to come of the public works serving a town, but, in regard to factories, it is always difficult to forecast expansion with certainty, as it involves too many unforseeable trade factors; and this fact alone, apart from questions of district amenities, is of great influence in determining the locations of factories in the outer environs of new towns where congestion is unlikely to arise for very many years.

The economic importance of this question can hardly be over-estimated. In this country, for example, very many factories have become closely surrounded by property in the course of time, and, in consequence, it is difficult or impossible to enlarge the premises to meet growing business; work is thus carried on less efficiently. Sometimes a second factory is built elsewhere, or the whole concern is removed to a new site. But the economic wastage and loss arising from cases of this kind throughout the length and breadth of the land are incalculable, and it is to be hoped that town planning, with the opportunities that it provides for taking long views, will do much to improve these conditions. The capital sunk in public works and factories is considerable, and if they have been laid down haphazard at the beginning it is very difficult, owing to the great cost involved, to obtain powers to have them removed to more suitable locations at a later date. And the same remark applies to the routes for railway tracks in a town.

The electricity, gas, water and sewage systems all fall within the province of the engineer, and the most economical lay-out of mains to meet the present and probable future requirements of the town for a determined number of years must be left to him engineer should, of course, lay these under the street system planned architect.

In the case of electric supply, the e always desires to keep the quantity of in the mains as small as possible, appreciably influences capital outlay. mission loss is closely connected with tity of copper, and it is also necess keep this low, for it affects generating of electric supply. These mains mi course, follow the street system, and latter can be planned without prejud other factors, so that an electrical distr can be ensured which involves a mi outlay for copper, consistently with transmission losses, there will follow manently lower charges for electric su

Somewhat similar remarks apply influence of street plan on the sizes ar out of gas, water, and sewage mains, b matter is of much less importance.

If we take the trouble roughly to out two or three alternative street plans town of given population and area, bearing in mind that the distributing (electricity, gas, water) and sewage within the town have to be connected trunk mains which are led between the and the respective public works sit generally, in the outer environs or in remote districts, it will be evident th size of the mains will be appreciab fluenced by the street plan and the sha the town area. The ground contours street gradients have a very considerab fluence on economical water service sewage carriage, for the former is a pr system, and hence it is affected by diffe in altitude, while the latter is, of cou gravity flow system, and it follows that collaboration between architect and en is very desirable in these cases also.

The choice of site for a new town a development of an adjacent area may, and in g will, have a very important bearin economic water supply and sewage di Here, again, the architect's choice of si town plan, with its gradients and diffe of altitude on the one hand and the eng municipal works on the other, are related.

The arterial system of ' locality ways, roads, canals, river -must ha important influence on the choice of s a town, and also, to some extent, on th out of the town. Economic transport sengers and goods demands this. In as the roads within the town are con this bears directly on the architect's pl in its connection with ground contou street gradients.

Two cases may arise: (1) The a system of roads and railways may b first, for the purpose of developing a d or (2) it may be laid down after the the town has been chosen. The ameni very many towns have been spoiled chosen railway routes through the town all the embankments, cuttings, bridges in addition, the smoke, noise, and vib If a town is built on very irregular g then objectionable features, such as r cuttings, embankments, and bridges ca railways over streets and streets ove ways, will, in general, be multiplied. relation between choice of site for a and street plan on the one hand, and, other, the choice of routes for railwa canals, has thus a direct bearing, not c the locations of bridges, but also on the bers of these costly structures that h be built. A river, and in some cases a flowing through a town usually provid of the greatest opportunities for dec landscape treatment in respect of the er ments and boulevards which can be la along its sides. And, if for no other the railway tracks in a town should n by the sides of rivers. Engineers pros

railways always take particular note of rs, for a sluggish stream generally indi- s easy gradients in its proximity, hence reason for railway tracks being found so uently by the sides of rivers and canals. water supply, sewage disposal, and the l system are all largely dependent on terrain of the whole district; and the er has, in respect of these points, an im- ant bearing on town planning.

here are many materials employed by both ineers and architects—varieties of build- stones, timbers, cast-iron columns, rolled- l joists, concrete, reinforced concrete, etc. British Engineering Standards Associa- carries out research work and testing on e of these materials, for the purpose of aring specifications suitable for the most eral practical applications. But a large unt of research remains to be done, espe- y on building stones and timbers, and e seems to be no good reason why archi- s and engineers should not combine in work for their mutual benefit and to ent overlapping and waste of labour and nse.

he architectural and engineering institu- s could do very much to bring about a er working union between these two pro- ions. By means of joint meetings, at ch papers would be read and discussions w, it should be possible to show that, in r own interests and in that of the com- ity at large, co-operation is very neces- .

EXHIBITION NOTES.

THE FINE ART SOCIETY.

would be worth going to the Fine Art erics to see the "Clouds on the Hills— o," one of the most delightful of Arnold stman's drawings now on view; it is an irable study of tone and colour. Other ings which reach a very high level of evement are 38, 44, 48, 10, 20, 28, and 26. most impressive and completely satisfying rawings have a breadth of treatment which ome cases makes almost a monochrome. e Nos. 28 and 10 in this exhibition and it be seen that the prevailing colour is a quiet n modified by brown and yellow. They are fine drawings. We certainly do not like

rest of the drawings so well as those we have ed, but this artist can be placid and broad ell as lively in his treatment, but at his best s in the front rank.

ne can hardly venture to say anything cal about the beautiful paintings by Fred ; one cannot even complain that they are otonously pleasing. On the contrary, there all sorts of effects of colour and light— nals, buildings, fields and sky may each in be the special charm. Where sky appears ll it is an integral and vital part of the ure; it may be a suffused glow of colour, or hung with grey clouds, or just a luminous kground for floating cumuli, or a grey veil with lingering wisps of cloud, but it is always an essential part of the picture. Altogether this is a very strong show.

At these galleries is also to be seen an exhibition of silversmiths' work by Georg Jensen. The

Silver Wine Cooler.

work of this celebrated craftsman has already been referred to in our pages. He knows the value of surfaces, of texture, and of how ornament may give distinction. Besides this, the general shapes of his pieces are such as strongly appeal to the architect. Silver is a beautiful metal, but nowhere has it been more vulgarised than in the ordinary commercial life of England.

OLD DUTCH TILES.

It is satisfactory to know that the Vis collection of old Dutch tiles, due to a generous benefactor, has been presented to the Victoria and Albert Museum. The collection is now arranged in Room 141 on the second floor of the Museum, and was opened to the public on December 1. Mr. Bernard Rackham has written a guide to the collection, which will shortly be available to the public. These tiles date from the seventeenth and eighteenth centuries, and are very representative of an art which has in the past conferred beauty on many an English home and is associated with English domestic work. We recall the now vanished but beautiful example of this use of the Dutch tiles in the Dairy of Ravenscourt Park, Hammersmith, now the Public Library, the walls lined throughout with beautiful tiles of this period, which we recall to have seen being removed at the time, by the pickaxes of the housebreakers when the dairy was unfortunately demolished. It is agreeable to think that such a vandalism is hardly possible to-day, and that we have a better sense of values than to destroy such historical and beautiful records. The history of this tile-making, often the work of local industries and forming an occupation for the winter in the countryside, may remind us of the value of an education which should fit the agriculturist and the country dweller to occupy his spare winter hours in craft work of perhaps a like kind, whereby the value of the hand and brain in a freedom from factory methods, could restore to us something of the quaint charm and treatment of work done in such a way. And the education required is as much that of the heart as the brain; in restoring to the individual the quietness of mind free from the need of unsatisfying excitement to express the best things in his own way.

INVENTIVE GREEK BUILDERS.

IN his third lecture on ancient Greek architecture, at the Central School of Arts and Crafts, recently, Sir Banister Fletcher said the origin and evolution of the Doric Order of Greek architecture was a tale in terms of architecture of the colonising activities of the Greeks in the sixth and fifth centuries B.C. Dorian to the west and Ionian to the east, they evolved both native and colonial types of architecture. The Dorian colonies in Italy and Sicily afforded remarkable examples of the character of a people expressed in its building, for the Doric temples, as could be seen to-day in the majesty of ruin, were grave, severe, and sturdy, like the Dorians themselves. Trading, colonising, building, inventing, they exhibited each successive phase of activity, and might be said to have invented the "orders of architecture," or systematised designs for the supporting column and supported entablature, which they used for the building of their temples. Lantern views of temple ruins at Faestum, Selinus, Corinth, and Athens, showed the use, dating back to 700 B.C., of the Doric or earliest and sturdiest order, which, like the other orders, had been used in all centuries down to the imposing entrance to the Euston Station of the present day. The lecturer discussed the probabilities as to the origin of the Doric order. Had it a lithic or a wooden prototype? Was it to be referred to the Egyptian rock-cut tombs of Beni Hasan or to the prodomos of the wooden hut? All we knew was that the builders found certain forms which suited their ideas and needs, and that they used them in combination and in one common material, the result being a perfection of form which was still recognised as a thing of beauty and a joy for ever.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Election of Members.

THE following new members were elected at a meeting of the Royal Institute of British Architects, held at No. 9, Conduit-street, W., on December 3:—

AS FELLOWS.

J. Allner, Poole.
A. R. Conder, Crouch End.
G. Drysdale, London.
E. C. Francis, Chepstow.
W. H. Godwin, Kidderminster.
F. H. Greenaway, London.
H.W. Hatchard-Smith, Epsom.
P. D. Hepworth, London.
O. Hill, London.
H. Hutt, Reading.
J. H. Markham, Harrow.
C. J. Marshall, Cheam.
A. R. Mayston, Finchley.
R. H. Morton, South Shields.
J. E. Newberry, Bedford Park.
W. G. Newton, London.
A. Sharp, Toronto.
L. S. Sullivan, Wimbledon.
G. Unsworth, Petersfield.
G. C. Wilson, Hendon.
D. Wood, Stanmore.

AS ASSOCIATES.

T.M. Alexander, Liverpool.
H. F. Billimoria, Colombo.
K. E. Black, Highgate.
S. N. Buchia, Bombay.
S. P. Bush, Rangoon.
R. J. B. Clark, Penzance.
H. A. Clist, London.
A. E. Davidson, Toronto.
C. C. Deuchar, Pretoria
W. Doddington, New Cross.
W. H. Eales, Victoria.
S. W. Fearn, Wellington.
L. R. Foreman, Brighton.
L. W. Hall, Watford.
F. L. Halliday, Manchester.
V. P. Haughton, Wellington.
S. D. Igglesden, Hampstead.
R. J. Masey, Anerley.
A. J. May, Bristol.
T. W. Milligan, Cape Town.
J. A. C. Moffat, Durban
S. G. Monk, London.
A. D. Parham, Colombo.
R. A. Riding, Earl's Court.
W. Ross, Glasgow.
J. E. Sterrett, Walthamstow.
S. Toy, London.
W. H. Trengrove, Christchurch.
H. A. H. Walker, Pretoria.
J. G. Wilson, Pretoria.

AS HON. FELLOW.

The Right Hon. Viscount Burnham.

AS HON. ASSOCIATE.

Sir Frederic George Kenyon (Director and Principal Librarian at the British Museum).

THE BUILDING TRADE.

THE COST OF BUILDING.

By T. P. BENNETT, F.R.I.B.A., Hon. F.I.O.B.

THE detailed examination of the result of *The Builder* Cost of Building Competition must begin with an examination of the designs.

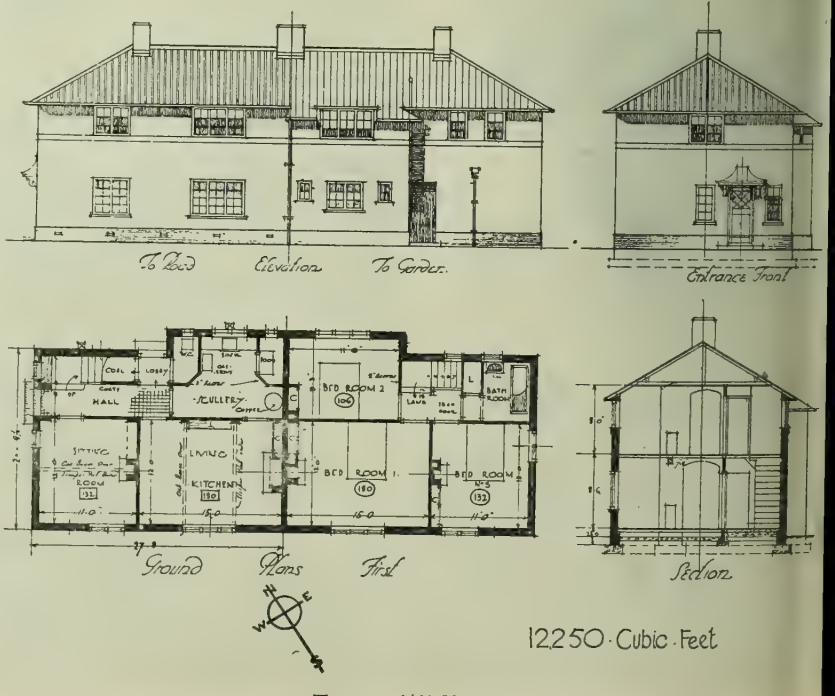
The winning designs for Types "A" and "B" have been subjected to an analysis and compared with economical detached houses recently erected, with the following result:—

House No. 1. Lowest tender, less contingencies.	House No. 2. Lowest tender, less contingencies.	Cottage Type "A." Prize-winning tender, less contingencies.	Cottage Type "B." Prize-winning tender, less contingencies.
£1,590	£926	£1,187 16 8 per pair, say £593 18 4 each.	£1,555 10 7 per pair, say £777 15 3½ each.

All figures given below are for one house in each case.

	House No. 1.	House No. 2.	Cottage Type "A."	Cottage Type "B."
Floor areas inside main walls	1,653	1,244	1,051	1,364
Cost per ft. super of floor area	19/2¾d.	14/10½d.	11/4¾d.	11/5¾d.
Cubic contents outside main walls	25,623	17,258	12,250	17,893
Cost per cubic ft.	1/2·8d.	1/0·86d.	11·74d.	10·5d.
Per cent. cubic contents to floor areas	1,488	1,357	1,165·5	1,311·8
Area of hall and passages and stairs, measured twice	188	103	140	178
Per cent. area of hall, passages and stairs to floor area	11·37	8·3	13·32	13·05
Roof area measured flat, allowing 1 ft. projection to eaves	1,110	833	692	914
Per cent. roof area to floor area	67·15	67	65·84	67·01
Length of external wall, including half party wall	125	117	87	119
Per cent. length of wall to floor area	7·56	9·5	8·28	8·72
Area of external wall surface	2,896	2,172	1,232	1,672
Per cent. external wall surface to floor area	175·2	174	117·2	122·5

Note.—House No. 1 included central heating with radiators in all rooms.



From this information it may safely be inferred that the designs in themselves are well and economically planned, and that the lowest tender is below rather than above the rates that are ruling. In other words, there is every evidence that an economical design has been awarded the prize in each case, and that the tenders have been cut to the lowest possible figure according to the demands of the design and specification.

As the ultimate purpose of the competition is to endeavour to indicate the way in which the cheapest possible houses can be obtained, the point is of great importance and immediately suggests an examination of the accommodation provided. The rooms in the winning design, Type "A," include a living room, scullery, sitting-room and three bedrooms, and the cost, according to the winning tender, amounts to £1,187 16s. 8d. per pair, or approximately £595 per house. This figure of £595 for a working man is high, and might, in the first instance, be substantially reduced if the scullery were omitted and the sink placed in the living room. With a corresponding reduction in the area of the bedrooms such an arrangement would represent a saving of about £60. Whether the working man tenant would be satisfied with such reduced accommodation or not is a matter for investigation in each district, but the possibility of such a reduction must be written down as of distinct importance, and one of the points which the competition emphasises. It is possible that a further amount of £10 to £20 might be effected by a cheese-paring process in connection with the size of the rooms, and this means of lowering cost would have to be considered in every instance.

Type "B" houses are not altogether in the same category as "A" because they represent an attempt to cater for a man who is able to pay for something that is above the minimum, and the question of how much the accommodation may be raised above the minimum is a difficult question. It may safely be said, however, that in this case the kitchen and scullery could be combined with less real loss to the amenities of the house than in the case of the omission of the scullery in Type "A." Such an amalgamation would probably mean a saving of approximately £30, while a reduction in the size of the sitting-room and cheese-paring elsewhere might save a further £18. This amount on the total cost of £777 is not great, and the four bedr house with its two sitting-rooms, kitchen scullery still costs about £730, which is q a substantial, although by no means ex sive, figure. The further investigation ceeds upon these lines the more it is sh that the prize-winning houses are planned, that they thoroughly deserve the tinction of their leading places, and that are houses such as might be reasonably manded in a normal district with an ordi clerical and working-class population o good type.

The specification embodied in the bills quantities issued for the second part of competition indicates a high grade of w In fact, it is a closer approximation to ideals of building than is usually poss when building takes place for commercial poses. Some of the items which call enumeration in this respect are reinfo concrete lintols, white-glazed ¾ channel p in the manholes, cement rendering to manholes, bitumen damp course, granoli hearths, boarded roofs covered with inodo felt, rebated floor boards, and lino covering cement floors. In the "Joiner" it must noted that all sashes have oak sills and doors oak thresholds, the pipes are suppo on pipe grounds, and there is a well-fi dresser. In the "Plasterer" rounded an to walls and to reveals and soffits of wind have a first coat gauged in cement. All fla ings in the "Plumber" are in lead; th are lead pipes for the water services un ground; there is a 5 ft. 6 in. bath and e a dust-bin. Finally, all outside woodwork painted. No one will deny the advisability the above work and it can hardly be ca extravagant, yet in a search for houses wh can be erected to meet the purchasing po of men with little if any capital, these are items which have to be seriously conside if economy in its strictest sense is of prim importance. In the "B" houses the s high standard of finish is demanded, and th are here and there items of a simple dec tive character which add to the cost.

These comments upon the specification r sound hypercritical, but there is no inten that they shall be construed as mere met lous statements. The cost of houses has r greatly, the standard of accommodation gone up so much that only by the exercis

Type "A" House.

strictest possible economy in small and in e items can the modern housing expert e to erect houses which, if built to sell, are in the means of possible purchasers, and uilt by housing societies, municipal autho-s, or other philanthropic institutions, can egarded as a serious and economic con-ution to the relief of the housing shortage. se prices of *The Builder* competition are, efore, for houses which, in themselves, are planned and designed with reasonable omy, the workmanship and finish accord-to the specification are to be of a high dard, and the price of £595 for Type "A" £777 for Type "B" must be accepted as lowest possible price at which houses of type can be built. To obtain a cheaper se (*a*) the accommodation must be re-d; (*b*) the standard of finish must be ered; (*c*) other and less satisfactory ems of construction must be employed.

he next point of importance is to ascer-whether there is any marked economy in ntry districts or in any specified area, or ther the cost of building is approximately same all over the country. It is safe to me that the average architect or builder gines that building is much more expen-in London and the large provincial towns elsewhere, but the result of the competi-does not at all bear out such an assump-. The twelve lowest tenders starting from bottom were submitted by builders work-in Swannington, Coventry, Witham, restoft, Exhall, Darlington, Wolverhamp-Willingham, Newcastle-on-Tyne (2), Ely London. The twelve highest starting the top were submitted from Boston. port Pagnall, Cowes, Llanelly, Brocken-t, Hampton-on-Thames, Chelsea, London Bristol, Newcastle-on-Tyne, Orpington. s the curious anomaly comes to light of inclusion of builders from the same town ngst the highest and lowest tenders, while highest tender of all comes from a com-atively small town in an agricultural dis-. As there are upwards of 175 competi-, the competition conclusively proves that, n equal conditions, it is no dearer to build large town than it is in a country dis-, and that the cost of building has reached air average for the whole of the country. is questionable whether this statement ld be true if cottages were built having ilar accommodation but constructed with l materials, and in order to ascertain the nt of local variations in cost and customs uestionnaire has been sent to 30 or more petitors. Competitors who do not receive pecial request are again asked to supply local information, as the point is un-btedly of great importance. The competi-next brought to light an extraordinary number of clerical errors in the tenders submitted. Even the best tenders were not free from this fault, while some of the others had extraordinary discrepancies. Taken at random, one tender had 28 clerical errors, increasing the total by £32. Another had 17 errors, making a difference of £9. In some cases the addition was at fault, and one competitor had sent in a tender with a mistake of £161 against himself, while others omitted sums of £35 and £30 respectively.

Carelessness in tendering is familiar to all, but the number of errors shown in these tenders seems to indicate so great a margin of error that, if it is carried into every-day practice, builders must constantly find that they lose work unnecessarily or are at times greatly inconvenienced or even faced with serious loss as a result of the slackness of office staff. Two competitors failed to price the bills of quantities, and sent in merely a lump sum, thus making detailed examination impossible. Next week a graph will be given showing the prices and tenders received, together with an analysis of the actual prices.

CHAPEL AND MEMORIAL SCHOOL AT REDHILL.

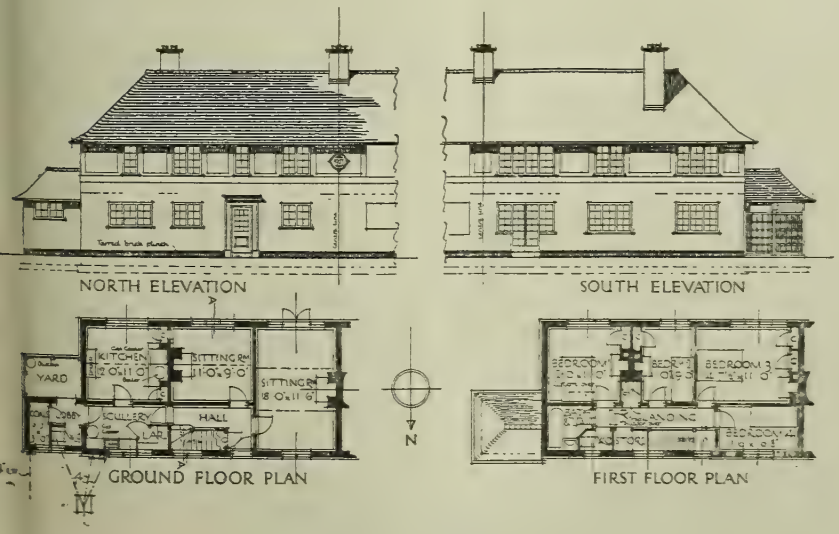
The Chapel.

THIS new building, which takes the place of the old prayer room—a temporary structure burnt down in 1922—is of plain design, in keeping with the surrounding buildings. It has been placed on the west side of the main buildings, and will form what is, in effect, the west side of a quadrangle.

The buildings, which are of substantial brick-work, tiled with hard Staffordshire tiles, are roughly oblong in plan, and comprise chapel, ante-room, cloak room, and lavatory. The main building, the chapel (34 ft. by 28 ft.), faces west, having on its south side a paved terrace from which the children can be watched at their sports, and on the north and east sides tiled verandahs (whose roofs are supported by massive posts and struts), which it is intended shall be used for convalescent children.

The external walls are covered with roughcast, the outside doors being of oak treated with oil, the oak posts of the verandah being stained and varnished. No elaborate decoration has been used on the interior; this being adapted for further decoration at any future date if desired. The interior wood-work is of oak; the wood block floors and dado being oiled; and the seating, which is of pleasing design, varnished. The windows are filled with steel casements containing leaded cathedral glass. The building is fitted throughout with electric light. A bronze tablet has been erected at one side of the platform to the memory of the "Old Boys" who gave their lives in the war.

The work has been carried out by the following firms: General contractors, Messrs. H. Bacon & Son, Coulsdon; constructional steel work, Mr. G. Banbury, Croydon; ironmongery and presentation keys, Messrs. J. Gibbons, Ltd., London; flooring, The Acme Flooring Co., Ltd., London; anthracite stove, The London Warming and Ventilating Co., Ltd., London; electric lighting, Messrs. Tamplin & Makovski, Reigate seating, Messrs. G. M. Hammer & Co., Ltd.; London; steel casements and leaded glass, The Morris Westminster Metal Works, London



Victory Memorial School.

This building has been remodelled, the plans being first approved of by the Education Department.

The ground floor contains a large hall, from which access is obtained to five good class rooms, master's room, cloak room, &c. The basement floor contains a cooking instruction room, scullery, pantry, cellars, cloak rooms, &c. On the first floor there is the master's house; and on the second floor, sewing rooms and further class rooms. All the work has been carried out by Messrs. H. Bacon & Son, Coulsdon, with the exception of the electric lighting, which was carried out by Messrs. C. Cooper & Co., Ltd., London.

The chapel and the alterations to the Victory Memorial School have been designed and supervised by Mr. J. A. Souttar, architect, 15, Upper Wimpole-street, London, W. 1.

Presentation keys used by H.R.H. the Prince of Wales at the opening of the Victory Memorial School and new Provincial Police Orphanage Chapel, Redhill, were manufactured by James Gibbons, Ltd., Wolverhampton, under the direction of Mr. J. A. Souttar, architect.

"Type B" House.

MODERN STEAM HEATING.

MR. A. J. Assheton, at the meeting of the Institution of Heating and Ventilating Engineers, held at the Engineers' Club, W.C., appealed to his hearers to be fair in their reflections, and not to confuse the early faltering stages in steam heating with the much advanced methods of to-day. He remarked that it should not be classed as a cheap make-shift; it deserved the same engineering skill and study as was paid to other branches of the heating profession. The use of steam as a heating medium was frequently adversely criticised; it was said that the temperature of steam was too intense for direct heating purposes and affected the air. This was one of the minor defects of central heating, but the result would be the same irrespective of the heating medium used. In parts of America and al of Canada it would be impossible to exist without heating of some kind; but in Great Britain the climate was not so severe, and it would be possible to exist without heating engineers. However, the growth of the heating industry had proved that the many advantages of central heating more than compensated for any slight defects. Many critics held that low pressure steam radiators decomposed air impurities, and it was true that unless cleaned there was an odour. Ventilation, however, would soon remove the odours, and the blame was not on the heating system so much as on the person responsible for the cleaning of the radiators.

Paving Works at Plymouth.

Plymouth Corporation Works Committee on Tuesday received from the Unemployment Grants Committee a promise of a 65 per cent. grant in connection with its scheme for repaving fifteen of the streets of the town, at a cost of £22,870, in order to provide winter work for the unemployed. It was decided to put the work in hand immediately.

THE LAKE IN ST. JAMES'S PARK—PAST AND PRESENT.

THE lately-reported leakage in the new concrete bottom of the ornamental water in St. James's Park naturally attracted considerable attention. It now appears from the official statement published in the Press that no occasion exists for anxiety, as everything is made all right and the leakage has been stopped. The old concrete bottom served, we believe, for nearly a hundred years with an occasional patch or two or periodical repair. In connection with this 1827–9 work it will be remembered that Aspdin, the bricklayer, patented his invention of Portland cement in 1824.

St. James's Park was a bare, undrained and comparatively swampy field comprising about 87 acres when Henry VIII enclosed it. The name of "St. James's Park" appeared first in 1539. The property belonged to the Leper Hospital, which stood on the site of St. James's Palace. Some attempt was made during the days of the Tudors to give the property some befitting amenities by utilising the ponds and water-courses. Queen Elizabeth, for instance, kept a lot of waterfowl and replenished and improved their habitable conditions, though her enterprise fell far short of the "brave alterations" carried out by Charles II on his return to London, bringing from his exile enlightened views imbued with Dutch taste for gardening. He employed Le Notre, the architect of the groves and grottos at Versailles, and Dr. Morison became the monarch's chief adviser. The result is well known. The Park of St. James's was laid out with a long, straight canal, with regular avenues of elms and limes stretching away from the Horse Guards Parade, with Buckingham House in the distance. The water-colour by J. Maurer illustrates this accomplishment. Pepys tells, under date of September, 1660, how he extended his walk from "Pell-Mell" to "see how they had proceeded in making a river through St. James's Park which I had never seen since it was begun." The king had thrown several ponds into one. There were also many surface waters existing before then. The further evidence recorded by Pepys is important. He "observed with the greatest pleasure several engines at work to draw up water," and "above all the rest" he "liked best" the invention by which Ralph Greatorex carried up the water at the angle of 45 deg. with "a great deal of ease," showing the abundance of the underground supply at that time.

There has always been a superabundance of water in St. James's Park. "Spring Gardens," at the northern extremity, suggests this, and a fountain hard by was fed therefrom. "Rosamund Lake," pictured by Hogarth and mentioned by Pope, made a favourite feature in the south corner of this Royal estate near the Queen's Palace, then called "Buckingham House." This structure figures in many old paintings probably, but a well-known print by S. Miller shows in a reliable way the original front of what ultimately became incorporated with Buckingham Palace. The Rosamund pond was afterwards called "a lake," filled up in 1770. George IV showed a degenerate taste for art and transmogrified what the Stuarts had accomplished in St. James's Park when he modernised both the water and walks, though some remnants of the picturesque remained and were incorporated, according to current fashion in landscape gardening, which was further developed during the Victorian era. Paths were made "winding and twisting," ensuring cosy and convenient rural retreats or "dead ends," warranting the title of Wycherley's comedy, "Love in the Wood; or, St. James's Park."

Canova, the celebrated architectural artist, whose topographical drawings of the Thames and Westminster are so highly valued, was asked after he had been thus engaged in London some while, what struck him most in England. The artist replied, "that the trumpery Chinese bridge in St. James's Park should be the work of the Government officials and that Waterloo Bridge was the work of private enterprise." This contrast is seemingly ever recurring and the ugly iron bridge still extant over the lake, also the present hard, ugly-looking verge to the new lake bed afford further instances in point.

The immediate connection of these pertinent references about the historic condition of St. James's Park and its present ornamental water bed arise from the prevailing springs and consequent intermittent running water surcharging this district and specially the Park itself. The houses in Queen Anne's Gate (or at any rate, on the north side) are built on piles, judging from one with which the writer had to deal towards the end of the last century. About this date Victoria-street, commenced twenty-five years before that, was being completed, and at the corner of the Broadway a very tall building was erected and standing isolated as it did then, before the adjacent premises were built, it assumed the proportions of a high campanile. The owners of the site next adjoining complained that the structure had been erected out of the upright so that it intruded upon their property sufficiently to reduce appreciably the area of their plot up above. Representatives of the owners of both properties met to try the rightness or wrongness of this assertion. They used the plumb-line with differing results. Sometimes the wall was vertical and sometimes it was out of the upright. It varied so much that it was decided that the plumb-line was no use for so great a height in the open air subject to the wind. Subsequently, therefore, it was agreed to employ an independent surveyor, w should test the wall with a theodolite. Perm sion from the vicar of Christ Church in Victor street was obtained to allow a concrete platfo to be fixed in the churchyard in a suitable po tion to thus sight the wall. The result was indecisive and uncertain that the surve repeated his test over a considerable period, with no better conclusions. Being acquainted with Westminster, he bethou himself of some old maps which led to investigation of a well far off at Hampste where he noted that when this well was full building at Westminster heaved over, and wh the well water was low this same struct became upright and normal. A spring gradua assuming the character of a stream (once m or less open, but now entirely covered in) ma its way through the district near Camden To incidentally taking on its way farther south old fish ponds, once associated with the L Mayor's garden house at the rear of Stratfo place, while in front, along Oxford-street, Tyburn from thence turned down Bond-str and in its course became linked up with waters from which Conduit-street got named a so travelled thus augmented southward till James's Park was passed and so away by Bro way across Victoria-street, when, by a left t eastward, it reached the Thames south of Abbey farther down clear of the site of Houses of Parliament. Roughly, that was surveyor's discovery, which furnished the ex nation of what had happened. Consequen both the owners of the Broadway building a adjacent site cried "quits" and paid betwe them the fees of the surveyors as a finis to dispute. The other buildings, being afterwa completed and wedged together, probably sta firm and do not move on the water-logged p below, regardless of the water flow still going

When the already almost-forgotten Ro Aquarium was erected facing the Abbey (op

site the Westminster Hospital on the site now occupied by the Wesleyan Memorial Hall) the enormous reservoir provided under the building to hold sea water soon went wrong. It was rendered inside throughout with asphalte to make it efficient as a container. The continuous soakage through the crown of the arch, however, caused the asphalte on its intrados to fall off from end to end above the normal top line of the sea water. This damage was due to the prevailing overplus of the land water. Below that level the weight of sea water kept the asphalte in position, though as the contents varied in bulk from day to day to supply the fish tank requirements, the asphalted surface towards the maximum line became correspondnglyu nreliable, and deteriorated by soakage and continued to blister off until the keeping of ish had to be abandoned. This happened years before the premises were demolished.

These incidents are important in regard to the ake bed in St. James's Park, and it may exercise ts influence upon the new work done by the Office of Works. When the water was taken ut of the Hanoverian basin on which the war-ime huts were built, the upward pressure of this and water probably disturbed the old concrete ed precisely as it heaved up " the tower " at the orner of Victoria-street as above described. When the lake was full the weight lessened the ater pressure from below and the water above lso solidified the old concrete bottom which the Government recently replaced.

WORKMEN'S COMPENSATION: SCOPE OF EMPLOYMENT.

The House of Lords has given a very important decision under the Workmen's Compensation Act in the case St. Helen's Colliery, Ltd., *v.* Hewitson. A good many of the colliery workers lived some five miles distant from the colliery, and the colliery company, recognising the importance of securing transport for their employees, had entered into a contract with a railway company providing special trains. By this contract the colliery company agreed to indemnify the railway company against any claims by these passengers in case of accident. Passes were issued to the workmen who desired to use the trains at a less fare than that agreed upon between the colliery company and the railway company, but the employees who used the railway had to sign an agreement with the railway company releasing the company from all claims in case of accident. On October 10, 1921, the respondent, a workman, whilst travelling by one of the trains, sustained injury by a railway accident, and the question raised in the case was, had he sustained an injury by accident " arising in the course of his employment " under the Workmen's Compensation Act, for otherwise by the above agreements he was deprived of any remedy.

The arbitrator had held that he was entitled to compensation, and the Court of Appeal had affirmed that award, but the House of Lords by a majority of four to one had decided otherwise, and this judgment may have considerable bearing on other decided cases under the Workmen's Compensation Acts.

All the judgments delivered are not yet reported, but Lord Buckmaster delivered the leading judgment, and that is reported in the *Times*, November 23.

It is important to observe that he agreed with the arbitrator in finding that it was an implied term of the contract of service that the train should be provided by the employers, and that it was an inseparable part of his contract of employment that the man should have the right to travel by the train, but it was held that it did not conclude the question in the man's favour, as he was not directed to travel by the train, and had he found it convenient, or desirable, he could have arrived at his work by other means, and the real question was, when he entered the train in the morning, was it " in the course of " his employment. The Court of Appeal had relied upon the case Cremins *v.* Guest, Keen and Nettlefolds (1908 1 K. B. 469; *The Builder*, July 4, 1908). That was a case very similar to the present, for by arrangement with the employers, a Colliery, the men were conveyed to and from their work in trains run by the Railway company in carriages owned by the Colliery company to a platform under the employers' control. Whilst standing on this platform an employee was knocked down by the train and killed, and the Court of Appeal held in that case that, as it was an implied term of the contract that the men should have the option of being conveyed to and from their work, the employment included the time of transit.

The House of Lords has now disapproved of this decision, and Lord Buckmaster, in the judgment now delivered, distinguishes between a case where a man has a right to use a means of conveyance and where he is under obligation to use it. Thus he pointed out that an employee entitled by his contract of service to a holiday with a free ticket would have a right to be in the train, but that it would be difficult to say, if an accident occurred to him, that it arose in the " course of his employment " when, as also in the present case, he was under no control nor bound in any way to use the train, and the case of Holmes *v.* Great Northern Railway Company (1900 2 K. B. 209) was distinguished, as the man in that case had been told to go to Hornsey, and a train was provided for him at King's Cross, and thus he was under orders at the time in question. Lord Shaw of Dunfermline dissented from the judgment of the rest of the House, and, moreover, indicated his opinion that the decision involved such hardship—these men being deprived by their contracts of any other remedy—that legislation would be required to alter the law as now laid down.

The important point in this dissentient judgment of Lord Shaw is that he considered that the present decision would overrule the cases Cremins *v.* Guest Keen, and Nettlefolds (" ubi sup "), Walton *v.* Tredegar Iron and Coal Company (B. W. C. C. 592), and Gane *v.* Norton Hill Colliery Company (1909 2 K. B. 539; *The Builder*, July 10, 1909). Walton *v.* Tredegar Iron and Coal Company was a case where a collier was allowed to travel to and from his work free of charge on a train provided by a railway company by arrangement with the employers, but under the contract of service with the employee he was to desist from using the train whenever required to do so by the employers. In attempting to join a train whilst in motion he was killed, and the Court of Appeal held that the arbitrator had been justified in holding that the man's conduct did not take him out of the sphere of employment, and that the accident arose out of and in the course of the employment, and in thus holding the Court of Appeal followed Cremins *v.* Guest, Keen and Nettlefolds. Gane *v.* Hill Norton Colliery appears rather different in character. There a man was returning from work, and he chose a short cut which involved crossing a line which was under the control of his employers when he sustained injury from some trucks which were being moved and the Court of Appeal held the accident arose out of and in the course of the employment: there were other ways the man could have used, but this was the shortest, and he used it with the knowledge of his employers. This case would have to be considered in the light of the decision in the House of Lords in Stewart & Son *v.* Longhurst (1917 A. C. 249: *The Builder*, April 6, 1917), a case in which it was held that, a point hitherto insisted upon, viz., that the place where the accident happened must be in the possession or control of the employers, was not essential, and as the place where the man was killed formed the only access to the place of work and was dangerous it was held that, as the man by his contract of service was compelled to be at that place when the accident occurred, he had sustained injury by accident in the course of his employment.

This fact that the man had to be at the place distinguishes Stewart *v.* Longhurst from the present decision and also from Thom *v.* Sinclair (1917 A. C. 127; *The Builder*, April 27, 1917), to which Lord Shaw referred in his judgment, and the present decision is supported by the case Davidson *v.* McRobb (1918 A. C. 304; *The Builder*, August 2, 1918), where the majority of the House held that a man was not killed in the course of his employment who had gone ashore from a ship for his own purposes and had met his death some sixty yards from the ship.

We have shown that this decision in the case we are considering in the House of Lords has thrown some doubt on some of the decided cases which have interpreted the expression " in the course of," but it remains to be seen what is the test to be applied now that decision has been given, and it appears that the test would be: was the man under his contract of service compelled to be at the place where the accident happened. In the case we are considering it will be seen, according to the finding of the House of Lords, there was no compulsion, as it was entirely optional, but we cannot but agree with the opinion expressed by Lord Shaw that the case is a hard one and some amendment in the law is desirable now such a narrow interpretation has been placed upon the expression " in the course of the employment." So long as this man was in fact proceeding to his work and taking the means provided by the employers to gain access to the place of work it would appear to the layman reasonable to consider he was in the course of his employment, even although he was free to select another means of arriving at his place of work, and it would seem beside the point to say that this cannot be so because if, under like conditions as to his ticket, when he was going on a holiday it would be argued he would also be in the course of his employment. The intention of the man and of his employers must surely be considered, and the distinction of whether a man is furthering his employers' business or only acting for his own pleasure seems the only simple test to apply. This decision is, however, now law unless legislative action is taken; and it will considerably complicate the law, for it throws doubt on the principle adopted in many decided cases. We may revert to the case when it is fully reported.

City Street Improvements.

It was decided by the Corporation of London on November 29 to postpone indefinitely the proposal of the Improvements and Finance Committee for the construction of a new street from St. Martin's-le-Grand to Gresham-street, across the old General Post Office site, and to proceed with the original scheme for the widening of St. Martin's-le-Grand to 80 ft. from Newgate-street to Gresham-street; the widening of Gresham-street from St. Martin's-le-Grand to Foster-lane, and the widening of Cheapside at Sweeting's corner to the junction with St. Martin's-le-Grand to about 95 ft.

Sewage Purification.

We have received from Messrs. Tuke & Bell Ltd., of 27, Lincoln's Inn Fields, W.C., a copy of a new booklet on country house sewage purification, which they have just issued. They are prepared to send this booklet post free to any architects, builders, or private persons who may be interested in the question of sewage purification.

Mr. George Robson.

The death occurred at the Grand Hotel, Newcastle, on December 1, of Mr. George Robson, aged 73 years, a well-known North of England master plumber and hot-water engineer.

THE SCOTTISH BUILDER

STONE DECAY: ITS CAUSES & TREATMENT.

DR. CARRICK ANDERSON lectured on November 30 to the Architectural Craftsmen's Association, Glasgow, on the subject of stone decay.

The lecturer said he proposed to confine what he was about to say to the wasting of the ordinary freestones used in Scottish cities, which was brought about by atmospheric influences.

It was important at the outset to remember that these freestones were sedimentary rocks, which meant that they were originally found as sediments or deposits in water. They had become consolidated into firm masses through the particles of sand having been cemented together by substances that were first of all dissolved in water. The commonest cements were carbonates and silicates of lime, and magnesia and iron, and also oxide of iron. None of these was soluble in pure water; each was introduced among the sand particles as a soluble bicarbonate through the instrumentality of water containing carbonic acid. As the water evaporated, the bicarbonates became broken up and insoluble carbonates were slowly deposited around the grains of sand, partly filling up the intervening spaces and uniting the grains to one another. By further changes the bicarbonate of iron became converted into red oxide, giving rise to the coloured sandstones, while bicarbonate of lime to some extent reacted with the small quantities of silica which were frequently present in natural waters to form silicate of lime. The sandstones so formed were still more or less permeable by water, and, if water introduced into them carried carbonic acid in it, the carbonates of lime and magnesia in particular would be liable to be redissolved as bicarbonates and so removed from their adhesion to the sand grains which would thus become detached. This dissolved carbonate was then ready to be transported whithersoever the movement of the water might carry it.

The purest country air contained nearly three parts of carbonic acid in 10,000, but in cities and towns this figure was increased as a result of the combustion of fuels and the respiration of men and animals in a limited area. In still weather and especially in fogs it might be doubled. Rain falling on a stone surface therefore, especially in a city, became charged with carbonic acid. In addition, it washed out of the air the sulphur acids formed from the combustion of the sulphur that was always present in coal, and gained a further supply of these active substances from the sooty particles that rest on every surface. Sulphuric acid thus became a constituent of the water that fell on any city building, and this when it penetrated the stonework changed the carbonate of lime into sulphate. It might be affirmed that as a result sulphates were present in all city decayed stones at one time or another in their history.

The progress of decay in the stonework of a building was marked by two stages which might be visible at one time on the same structure. It was matter of common observation that the earliest indications of decay generally took the form that individual stones began to crumble on the surface and to throw off particles or scales, and that it was often only a considerable time after that anything like a general disintegration of the surface set in. Both the localised and the more general form of wasting were brought about by the movements of water within the stonework, but they operated in different ways to produce the two results. When acid water penetrated the stones it dissolved some of the lime cement and then in drying out deposited this anew in positions different from those from which it had been removed. These new deposits would be formed in largest amount on and underneath the surface of those stones from which progressive evaporation took place most freely, either by reason of their porosity or their position, or from some other cause or combination of causes determining the ready escape of water from their surface. The sulphate of lime carried by this water was deposited in the surface layers when the water evaporated and by its expansion when crystallising burst off the outer particles of sand. It was this that appeared to produce the localised areas of wasted surface that were the early symptoms of decay. The material, however, that by its accumulation in these places produced such effects had been steadily withdrawn from other parts and the cement was consequently undergoing reduction elsewhere. By and by this depletion would reach a point at which a general softening of the surface became manifest to the eye. The building had a washed-out appearance and the general surface was soft and crumbling.

It was the same movement of soluble saline bodies, constituting the so-called "quarry sap," that by its manifestations afforded foundation for the builder's dislike of putting recently quarried stones into a building.

The remedies proposed might be grouped for the most part under one or other of two heads: (*a*) Those in which a vulnerable cement existing in the stone was intended to be replaced by one less open to attack by atmospheric agencies, this being effected by the use of an active chemical substance; (*b*) those in which attention was directed towards preventing or minimising the entrance of the destructive acid water into the stonework. In the former class were included water glass, the fluosilicates or fluates, and the sulphates of aluminium and of zinc. In the lecturer's experience such remedies had a very limited value. The substitution of a natural cement slowly formed over a long period by one theoretically more stable but quickly produced, and in any case of improved powers of adhesion, was a policy of doubtful expediency, and, in view of what had been said regarding the part played in stone decay by the internal movement of saline water, it appeared to leave untouched the chief agency in the destructive process. Of the class of waterproofing agents the commonest was, perhaps, paraffin oil either alone or along with raw linseed oil and with the latter sometimes an admixture of white lead. These were cheap, and for a time had the effect of excluding rain water. They were, however, not permanent, and either singly or together had the result of darkening the stone, producing a sorry effect that had generally to be counteracted after a few years by a larger addition of white lead or other paint, so that in time the stonework was entirely overlaid and buried out of sight.

Wax preparations formed a considerable class, and had the advantage over paraffin and linseed oils that they did not directly disfigure the building. The wax, however, remained always soft, and was apt thereby to cause increased adhesion of dust and soot particles to the surface of the stonework so that indirectly in time the wax covered surface was darkened as compared with an untreated surface of the same stone. A more serious disability, however, attended the use of these wax preparations, due to the fact that wax did not readily penetrate freestone and while the solvent might enter a considerable distance, the greater part of the wax remained on the surface and was gradually removed by rain and wind. The ideal preservative for use alike on new and on wasted stonework should combine, as far as possible, the qualities of ready penetration, pronounced waterproofing power, and adhesiveness to the extent of reinforcing the existing natural cements in the stone, and so hardening and consolidating its outer layers. It must at the same time be nearly colourless and transparent so as not to affect the natural shade and grain of the stone and finally it must have a high degree of permanence in resisting the influence of a moist and contaminated atmosphere.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Masons' Labourers.	Plasterers' Labourers.

Dundee.—OFFICES.—New offices at Wallacetown Public School, Crescent-street, for Education Authority. All particulars from Mr. J. Williams, executive officer, Education Office, Dundee.

NEW BUILDINGS IN SCOTLAND.

isley.—The Dean of Guild Court has passed for seven houses.

rling.—The T.C. has passed plans for ions and alterations to property in Baker- t, for the Trustees of the Holy Trinity ch; a cottage at Randolph-road, for Mr. A. s.

lry.—The Northern District Committee of Ayrshire County Council has received the ion of the Board of Health to erect 12 es at Dalry.

atbridge.—The Dean of Guild Court has d plans for an extension to the new institute, hall, at an estimated cost of £380.

eghorn.—At the last meeting of the North- District Committee of the Ayrshire County cil, held at Kilwinning, it was stated that rt had been made on the erection of 10 es at Dreghorn, estimated to cost £4,295 ld.

ndee.—The Park Committee proposes to a bandstand in the Baxter Park, the nated cost of which is £1,610.

inburgh.—In connection with the proposed ision of a new hospital, the directors of Edinburgh Royal Maternity and Simpson orial Hospital have decided to appoint an ential committee to represent the various es interested, to consider and report on the ect generally, and especially as to future ions with the hospital and infirmary and o suitable sites.

asgow.—The Corporation propose to invite petitive designs for the erection of a new ic hall on a site in London-road and Charles- t.

evenston.—The Northern District Committee e Ayrshire County Council has received the d's approval to the erection of 36 houses tevenston.

ltcoats.—The Corporation Public Health mittee has been authorised to make investi- ns and report on the possibility of remodel- the buildings, formerly used as a creamery, ousing purposes.

rt William.—The T.C. has decided to apply he Scottish Board of Health for authority rry out a modified scheme for the improve- of the insanitary area on the north side High-street, between Fraser-square and Nevis Hotel-lane. This scheme will sitate the acquisition of a number of erties and the erection or reconstruction of uses.

ith.—The Northern District Committee of County of Ayr has been authorised to erect uses at Beith.

Land for School Purposes.

. Howard Martin, Official Arbitrator, has d his award in a claim by Mr. Arthur John nnell against the Kent County Council g as the Local Education Authority), con- ng the Council's compulsory acquisition of old land having a frontage of 138 ft. to r Holly Hill-road, Belvedere, and com- g 2 roods, 1 pole, 8¾ square yards or there- ts.

e award is as follows:—". . . it being d that a strip of land 12 ft. in width adjoin- he land subject to the notice to treat making al frontage of 150 ft. is to be included in the nase, I award that the Acquiring Authority pay the claimant the sum of £450 as com- ation, and I order the Acquiring Authority ay for the stamp on the award, and the ant to contribute £26 5s. towards the costs e Acquiring Authority."

Obituary.

e death has occurred of Mr. Richard an, one of the partners in the firm of rs. R. Morgan & Sons, builders, Kidwelly marthenshire). The deceased was 59 years e, and intimately connected with the public f the district.

e death has occurred, at Tynedale-terrace, nam, of Mr. Edward Snowball, aged 82, der and contractor, and one of the oldest and esteemed residents of the town.

RATES OF WAGES IN THE BUILDING TRADE.

(For rates of wages in the Building Trade in Scotland, see page 900.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

McVitie & Price; nine houses, Brondesbury Park, by Mr. Stanley Allen, for Messrs. Western & Arnell; 12 houses, North Way, Neasden, for Mr. J. M. Goodwin: house, North Way, Neasden, by Mr. James Denton, for Mr. D. Smith: house, 2, Donnington-road, Willesden, by Mr. A. L. Tolcher, for Mr. J. Jones: institute and school-room, Acton-lane, Harlesden, by the Rev. E. F. Sutton, for the Harlesden Baptist Church; St. Mark's Vicarage at junction of Furness-road and Holland-road, Harlesden, by Messrs. Alder & Turrill, for the Rev. E. R. Whalley; two houses, Dollis Hill-lane, Cricklewood, by Mr. H. E. Beckett, for Broadway Properties, Ltd.: three shops, Normansmead, Brentfield Estate, by Mr. A. Franklin, for Messrs. Blincow, Shacklady & White.

YORK.—The London & North Eastern Railway Co. are going to enlarge the existing hotel motor garage at York to accommodate 100 cars. The scheme embraces several lock-ups for cars, waiting rooms for drivers, and vulcanising room, &c. A cottage at Nether-lane, Nafferton, is to be built by the London & North Eastern Railway Co. Plans passed by T.C.: City Picture Palace Co., dancing hall, &c., Fishergate; W. Johnson, house, 189, Bishopthorpe-road; Sir R. Newbald Kay, two houses, Beech-avenue; G. H. Pegg & Son, house, St. Clement's-grove; G. H. Pegg & Son, house and shop, Bishopthorpe-road; E. Relton, two houses, Carrington-avenue; Atkin Bros., three houses, Poppleton-road; G. H. Pegg & Son, 15 houses, Aldreth-grove, Cameron-grove, and Bishopthorpe-road; Sir R. N. Kay, two houses, Bishopthorpe-road; R. J. Parker, house, Moorgate.

FIRES.

ABERDEEN.—A destructive fire has occurred at the engineering works of Messrs. John Lewis & Sons, Pointlaw.

BRADFORD.—The four upper stories of a seven-story building at the junction of Nelson-street and Clarence-street, occupied by Messrs. Thomas W. Sowden & Co., wool merchants, and by Messrs. Henry Longbottom & Co., wool merchants, have been destroyed by fire. The premises were the property of Mr. Henry Cullingworth.

NEAR PONTYPRIDD.—Fire, on November 30, at the residence of Sir Rhys Williams, Bart., D.S.O., K.C., Miskin Manor, near Pontypridd, destroyed completely one wing of the building. Damage is estimated at £10,000. All art treasures were saved.

NEW INVENTION.

Fire Alarm.

THE Gravity Auto-mechanical Fire Alarm, a clever contrivance, is being demonstrated at the Institute of Patentees, 44, Great Russell-street, W.C. 1. It consists essentially of a flexible metallic cord, anchored at one end, traversing the building near the ceilings and having a weight suspended from its distant end. The weight is always pulling, keeping the cord taut. The cord is guided by small pulleys in the directions required to cover the area to be protected. A separate length of cord is used for each floor or each section of the building which is to be made fireproof, and the ends of the cords are brought to some central point where their weights are enclosed in a case. Into these cords are looped at intervals of about 20 ft. small flanged rings built up of brass stampings, held together by a fusible metallic alloy. Ten inches of cord are looped round each ring.

When a dangerous temperature is reached a ring or rings collapse, the looped cord is drawn out and the weight drops through a corresponding distance. The dropped weight shows a red band through an aperture in the case, so the locality of the fire is seen at the central indicating point. On falling, the weight trips a trigger which sets a large bell in continuous action—the bell being also weight-driven. This bell beats out a continuous alarm, which can be heard at a considerable distance from the building, and summons local aid. The weight also closes the ordinary telephone circuit, just as the lifting of the receiver does, and calls up the Exchange. Near the bell is a telephone transmitter, and this transmitter, so to speak, "hears" every blow of the bell, but by a contact disc on the bell movement is rendered "dumb" except at predetermined intervals, so turning the continuous sequence of blows into an intermittent code. The Exchange is therefore called, and the operator hears a number clanged out by the transmitted blows of the bell. This is recognised as a fire call, and connection is at once made with the fire station, where the same code number is heard many times repeated.

The General Post Office have, we understand, investigated the system, and have agreed to operate it in any part of the country, and the Chief Officer of the London Fire Brigade and other leading Fire Chief Officers have examined the system and expressed their approval.

The inventor is Mr. Chas. Smith, of Electra House, Moorgate, E.C.

Quantities.

In reference to the letter which appeared in our issue of November 23 under the pseudonym "Quantities," Messrs. Chapman & Hall, Ltd., inform us that they have just published a book, entitled "Quantity Surveying for Builders," by Mr. Wilfred W. Evershed, in which the methods of measuring explained throughout the volume have been brought into agreement, where necessary, with the "Standard Method of Measuring of Building Works."

National Registration of Plumbers.

A conference under the auspices of the General Council for the National Registration of Plumbers was held at the Newcastle Town Hall, on November 30. Mr. H. D. Searle-Wood, F.R.I.B.A., of London, occupied the chair.

At the evening session, in the course of a paper prepared by Mr. W. D. Caroe, M.A., F.S.A., the lecturer said he wanted their craftsmen to claim their privileges; to get architects and public authorities to employ registered plumbers by preference; to ventilate the system of marking to distinguish their work; to improve funds in order to employ an organiser; to press for the proper teaching of technical and practical instruction in harmony with the registered system; and to encourage a scheme of apprenticeship.

In the discussion that followed, the speakers generally advocated that registration should be adopted by the trade.

CURRENT PRICES FOR BUILDING WORK IN LONDON.*

EXCAVATOR.

		s.	d.
Digging and throwing or wheeling and filling carts, and carting away to shoot—6 ft. deep	per yard cube	11	6

TRADE NEWS.

A new waterproofing material has been brought to our notice called "Sika," and the special points the makers claim with regard to it are that it makes Portland cement or concrete set in less than a minute, and the time of setting can be regulated. Also it is claimed that it stops leakage immediately without relieving the water pressure. "Sika" is prepared in the form of liquid, and we are iuformed that when it was applied outside a sewage tank it stopped leakage against considerable pressure of water. The agent for London is Mr. G. H. Smith, of 25, Stratford Place, N.W.

Messrs. Hartley & Sugden, Ltd., of Halifax, are placing on the market two new and improved models of "Thermostoves." The two new models embody the following improvements :—Increased size of oven, which is now 16 in. wide by 14 in. high by 15 in. deep, and an entirely new feature applied to ovens is the sliding oven doors—these doors slide as if on ball-bearings—obviating the necessity of removing pans from the hot plate when attending to the oven. The hot-plate surface has been considerably enlarged. The grate is now fitted with a foot pedal for shaking purposes, and two nickel-plated towel rails are fitted.

We have received from Messrs. Cafferata & Co., Ltd., a copy of their "Murite" booklet, in which they say "that in all operations involving the use of plaster the question of time invariably presents something of a problem. The relatively low cost of lime plaster has determined the general adoption of this medium for everyday work. Highly alkaline properties render lime plaster unsuitable for many kinds of decorative treatment. In certain cases lime plastering tends to destroy the colour of wall paper and some distempers entirely fail to get a 'hold' on its surface and can be rubbed off as soon as dry. The introduction of a plaster, therefore, which overcomes all these defects at a practical price introduces a new epoch in the history of plastering. Prolonged research has finally produced in 'Murite,' a gypsum plaster whose results are equal, if not superior, to the best hitherto obtainable, and whose first cost brings it within the scope of every estimate."

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV.—No. 4219. DECEMBER 14, 1923.

CRITICISM PERMANENT AND PASSING.

CRITICISM, when applied to any of the arts, is of two kinds; it is either such as will be true at any time, as much in any future generation as now; or it is such that when the passing fashion of thought has gone its way it will be found to reflect not so h actual truth as the circumscribed vision of a mode-ridden d Those who feel called upon to express opinions on the k of brother artists must, if they wish to be conscientious, the secret of the difference between the one style of criticism h is good and the other which is both bad and superfluous. Every generation has its passing vogue, which often runs ugh the veins of artistic life like a fever. When the ie is, as it sometimes is, based on sound conceptions of ty the most scholarly and deliberate of critics are in ger of being warped by the seductions of their favourite style, heir criticism will be lessened in value just so much as that icular weakness of theirs has forced them over the true balance ne and meticulous judgment; and when it is bad, as we sometimes seen it, it will irritate those same scholarly and we shall be in danger not only of losing the power erceive any poor struggling flowers of good that may exist ng the tangled weeds of evil, but criticisms will again in value exactly what they have allowed themselves to in truth.

t would seem, then, that criticism which is to be of value come from those who, as a correspondent expresses it, "an admixture of encyclopedia and saint"; and also those who conceive and execute the works of art will be e whose criticism will be most valuable. But we know this is very far from the truth, for the greatest critics in have not been themselves the greatest or even great utants, possibly because their critical faculties were so t that they killed their own creative faculty by introtive cruelty. We have also to bear in mind that although y may be called upon to exercise their critical faculties, such ey are, for the benefit of their fellows, it is given to few e critical geniuses, for we can count the great critics ny sphere of life in their generation upon the fingers of own hands. How then should critics approach that h they have to criticise? Certainly they must approach ith as near to a perfect lacking of bias and preconception ossible. In so far as they go to their work with their own s of what they should see, their work will be bad. But they t also go forth properly equipped with knowledge or they it rate the designer of a façade of prison cells, for instance, ot having provided large and uninterrupted window spaces, illory a poor designer of a conservatory for using too much .

t appears to be reasonable to suppose that bias will be less y to be present when we are dealing with mundane facts in the frenzy occasioned in every man's heart (that is if as the heart of an artist) by the more delicate work of gn which is really lineal poetry; but to be successful the gn to be criticised must conform to the mundane before it can rise to the sublime. It should therefore be possible to appreciate a design working upwards from the practical to the æsthetic, and it will very often be found, if not indeed most often, that a design comprising the one will contain the other, so much is beauty linked with fitness. A critic can say without heat whether a design is *par exemple* so arranged that a good system of traffic circulation and inter-communication is obtained; he can express without anger his opinion as to the economy or otherwise of collecting and dispatching raw materials and the completed article from a vast factory; he will know and be able to say without any quickening of the pulse whether the problem was one which called for generous lighting or whether it was better served with the more dimly religious atmosphere of shadow; but when he comes to the vexed and vital matter of façade and section every competent judge feels that itch which is the inherited affliction of the man of strong convictions, and then he is in danger of railing or raving and so proving himself prejudiced and incapable, it may be, of doing justice to the building he wished to appreciate, for its merits and demerits will remain what they are, see he them or not; and he may also do what is much worse, which is that if his criticisms are read by the younger men he may set them in a state of mind as unhealthy as his own. The critic, then, must find some medium for approaching the artistic side at least as calmly as he has done the mundane, and it should be possible by some simple mental discipline and the formulation of a rough scale of what the elevation should attain. It will probably be found that the façades will permit of some rough test of merits from the practical side—of stability, light, colour and fitness.

Then, last of all, the critic comes to the best of all—the sincere effort of the designer to clothe the gaunt bones of his harsh problem with the flesh of beauty; and here he must forget his personal partiality for the imposing column or delicate lacework and ask himself, before he lets his judgment fall, if the style fulfils its practical requirements, if it conveys its purpose by its design—for every building should do that or it is not good—and if the style chosen is the most suitable to its needs and ornament. When he has piece by piece worked through all those hard and set restrictions he will find that his criticism has been appreciative rather than egoistic, and finally his own bias towards styles will be largely lost, for the building has made its own style, and he has only to say if the style has been well or ill limned and let himself have some freedom if possible in the happiness of praise or the sorrow of censure. What would seem to prove that fashions in architecture are dangers to the critic is that as one generation gives place to another there are always outstanding buildings, marking the years they filled; and however the styles fluctuate, these are recalled as good and will ever remain good to us all; and these buildings are good because of their own merit over and above their relation to the fashion of their time. They are the headstones of those who condemned them and the monuments of those who praised them.

NOTES.

All Hallow's Church. This well-known City church, the work of Wren, has been closed for several weeks for repair and redecoration carried out under the supervision of the architect to the Society for the Protection of Ancient Buildings, Mr. A. R. Powys. We were glad to notice, in an account of the celebration of the completion of the work, when the Lord Mayor and Sheriffs attended in State, that the Bishop of Croydon, who preached on the occasion, in the course of his remarks, said: "The work has been done partly as a demonstration of the pain which the very thought of the demolition of these churches gave to many. Many of them," he said, "were the work of England's greatest architect, as that church was, and, as such, must have priceless value"; and added, "between 11 and 4 o'clock in the day the church would rarely be found unoccupied." It is hardly necessary to labour here the deep hostility felt for the proposals of the Bishop of London by so many people, or how badly it reacts on the Church's influence, which should be directed to preserving the evidence of the religious life of the country in the monuments which enshrine it.

The Advertisement of Architecture. In his useful contribution to the advertisement of architecture, in a weekly paper, Lord Riddell says: "Probably most of us would find it hard to name the twelve most important British architects—dead or living. Wren (St. Paul's), Scott (the Houses of Parliament), and Lutyens (the Cenotaph) would probably exhaust most rolls of architectural saints." The worst of it is such rolls would be wrong, for it is almost as certain as anything can be that the Houses of Parliament buildings were produced by Barry and Pugin.

Repair of Historical Buildings. The repairs of historical buildings have a more varied appeal than is afforded by history alone. To the antiquary the preservation of the genuine evidences of the past unobscured by modern additions would seem to be of the greatest importance. Artists, tourists and sight-seers will be inclined to approve modern repairs if they are carried out in such a manner as will preserve the harmonies of the building as a whole; if unpleasant blots of new material have been avoided, and especially if the conservator has found it in his heart to leave some flowers and foliage around the building to contrast with its masses of masonry. The constructor may be interested in one or other of these aspects of repairs to ancient buildings, or in both or neither, yet find something worth his consideration in the manner in which the repairs themselves have been designed and executed.

Jedburgh Abbey Conservation. On page 923 we publish an account of the repairs at Jedburgh Abbey recently completed by H.M. Office of Works. These works have been carried out in such a manner that little evidence of their presence can be discerned except when purposely searched for and must be admitted to be satisfactory from several points of view. Historic evidences have been preserved with the most scrupulous care and, for the artist, the sensible arrangement of concentrating flowers and foliage in the neighbourhood of the Abbey instead of upon its walls has helped to maintain beauty in the general appearance. This unity of effect is only slightly interrupted by the retention of some former rather unsympathetic works of repair that happened to be structurally sound. But time will doubtless soften their harshness. Constructionally considered, the recoring of the two defective Norman piers of the tower was an unique operation at the time, and though similar work has been carried out more recently at Rievaulx Abbey by the Historic Buildings Branch of H.M. Office of Works, the repetition of a daring *tour de force* of building only adds to its interest.

Experiments in Construction. These experiments in special forms of building construction have been applied to ruinous and uninhabited buildings, but the knowledge gained by experience should be available for use in places of present-day activity. The defective central piers of St. Paul's Cathedral now showing signs of disintegration under the eccentrically applied load of the dome will one day require the application of some adequate scheme of repair. Frequenters of the building have seen a network of steel centering placed in position and removed again without being able to learn what service it had performed, and it is to be hoped that whenever active works are recommenced those in charge of

n will have learned the lesson of burgh and will proceed with the assur- e that comes of undivided counsels and tionally developed plan.

The ogress of Vomen.

The advancement of women in various fields of work continues satisfactorily. The position of four women in prize lists for sculpture at the Academy ools this year is worthy of note, be- se one feels that generally speaking the ial point of view which produces good pture, whilst rare enough amongst , has seemed rarer still amongst nen. Now, an opportune plea, by M. Upcott, for the employment of nen in the control and management house property has just appeared, aced by good introductory notes n Lady Astor and Mrs. Wintringham. re can be few matters about which so t benefit can be conferred on the mmunity as the improved conditions ouse property, both for the well-to-do the poor. It may not follow that will always coincide with money- ing. Just as in the case of doctors, y of whom make a comparatively r living, though they confer lasting efits on thousands of lives.

Crosby Hall.

The appeal now being made for funds to buy this beauti- ful fifteenth-century Gothic banqueting hall, which stood Bishopsgate for 400 years, has two t aims, viz.: the utilisation of the hall and the establishment of an inter- national club-house for university women under its roof. Since its removal to Chelsea in 1909 the building has not been put to any permanent use, and the British Federation of University Women has now come forward with a scheme to purchase the hall and land, and build on a residential wing to accommodate forty women graduates, a club-house and lib- rary, for which £30,000 is needed; while it is intended that the banqueting hall shall be available for inspection by the public. Mrs. Stirling, who has brought together a very fine collection of the pottery and pictures of William and Evelyn de Morgan, intends to give it, together with an endowment fund, to some corporate body in Chelsea which will throw the collection open to the public, and, if sufficient funds are forthcoming under the Crosby Hall endowment scheme, there is a likelihood that a gallery for this collection will also be included in the project.

Unqualified Ex-Soldiers and Building Craft.

Probably no more con- vincing confirmation of Mr. Arthur Keen's timely letter in *The Times* of last Friday could be produced than this communication received on the same day by a well-known Fellow of the R.I.B.A., who, being personally unable to find a job for the applicant, has forwarded us a copy of his application. In the course of his letter, the applicant says: "I arrived from Canada on Saturday, having been out harvesting, and am now looking for a job. Before the war I attended the Regent-street Polytechnic and took a technical course there in building construction, mechanical drawing, and architecture, but, of course, on leaving the Army, having served from 1914–1919, had lost five years' work, and had to take various jobs to get some money together again. As I intend to settle in London, would it be possible for you to place me in your office as a junior, perhaps as a tracer or general help? I would require no salary for the first month; perhaps after I may be worth a little to your firm. If you had no vacancy in the office, perhaps there might be a job as foreman or time-keeper on one of your buildings? I am not afraid of work, and I assure you, Sir, if given a start, you would be quite satisfied as to my ability." As the Hon. Secretary of the R.I.B.A. says, "it is a very serious matter that, among the young fellows who came out of the army, there are great numbers who are not equipped for earning their own living. Those who have had a superficial training in some trade have not sufficient skill to ensure regular employment." Here is a case seemingly of a perfectly genuine sort in which such an one is seeking an engagement as "foreman," who has no real expert knowledge for such a post. As an example, as it appears, of a worthy, willing young ex-soldier, it is distressful enough, but being typical of vast numbers in a similar plight, it is appalling.

GENERAL NEWS.

Professional Announcements.

Messrs. J. Hatchard-Smith & Son, FF.R.I.B.A., architects, 11, Haymarket, S.W.1, have opened a branch office at Budleigh Salterton, South Devon.

Mr. John P. Blake, P.A.S.I., has relinquished his appointment of Resident Architect to the Heston and Isleworth Urban District Council, and taken up private practice at "Norvic," Hibernia-road, Hounslow.

Royal Institute of British Architects.

Mr. Alfred C. Bossom, of New York, has been elected a Fellow of the Royal Institute of British Architects by the vote of the Council. Mr. Bossom, who has practised in New York for some 20 years, has retained his British citizenship and is keenly interested in the welfare of British architecture and has recently founded, under the control of the R.I.B.A., a valuable travelling studentship to enable young British architects to travel in the United States and study the methods of American commercial architecture.

Memorial to the late Bishop of Chelmsford.

It has been decided that the memorial to the late Bishop of Chelmsford should take the form of an extension eastwards of the chancel of the present Cathedral at Chelmsford, with a personal memorial to the late Bishop. It is proposed to take down the east wall of the Cathedral and to extend it outwards to enable canons' stalls to be placed in the chancel. The question of whether the proposed extension should consist of two bays or three bays is deferred for further consideration.

Light from the Ancient to the Modern.

Mr. Frederic H. Taylor recently lectured at Stoke Newington on the various aspects of light. In the first half of his discourse he dealt with its early history, its religious significance, and the various forms of ancient lighting. In the second half he dealt with modern developments represented by oil lamps and gas and electric lighting; and finally the lighting of London, ancient and modern. The lecture was illustrated by a number of slides.

Waterloo Bridge.

The subsidence of the piers of Waterloo Bridge has necessitated an inspection by the London County Council. From the Embankment can be seen the scaffolding from which examination is being made of the piers and structure generally.

Old London Demolitions.

"A certain amount of antagonism will be aroused," says a contemporary, "by the decision of the Freemasons to clear the site in Gt. Queen-street upon which their headquarters stand, and erect new Grand Lodgebuildings as a Masonic Peace Memorial. In vain did learned bodies and private persons plead that the beautiful Inigo Jones house in which Boswell was said to have lived, and which stood on the western extremity of the site in question, should be saved for posterity. Now the building which took its place is to go also."

MEETINGS.

FRIDAY, *December* 14.

Town-Planning Institute.—Mr. E. R. Abbott on "Streets." At 92, Victoria-street, S.W.1. 6 p.m.

London Society.—Mr. A. Trystan Edwards on "Good and Bad Manners in London Architecture." At 18, John-street, W.C.2. 5 p.m.

MONDAY, *December* 17.

Royal Institute of British Architects.—Mr Raymond Unwin on "Higher Buildings in Relation to Town Planning." At 1, Wimpole-street, W.1. 8 p.m.

WEDNESDAY, *December* 19.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Theatres, Tomb, Town-Planning and Public Buildings." At Southampton-row, W.C.1. 6 p.m.

COMPETITION NEWS

University Pavilion, Glasgow.

In this competition the assessor, Mr. Alexander N. Paterson, A.R.S.A., of Glasgow, has made the following awards:—1, Mr. James M. Honeyman, 194, West Regent-street, Glasgow; 2, Mr. Will J. B. Wright, 170, Hope-street, Glasgow; 3, Messrs. John Burnet, Son, & Dick, 239, St. Vincent-street, Glasgow. The design placed first is given in this issue.

Swansea Masonic Temple.

Designs submitted in open competition by Messrs. Willmott & Smith, of Cardiff for a new masonic temple at Swansea, have been placed first by the assessor, Mr. Arthur Ke F.R.I.B.A., of London.

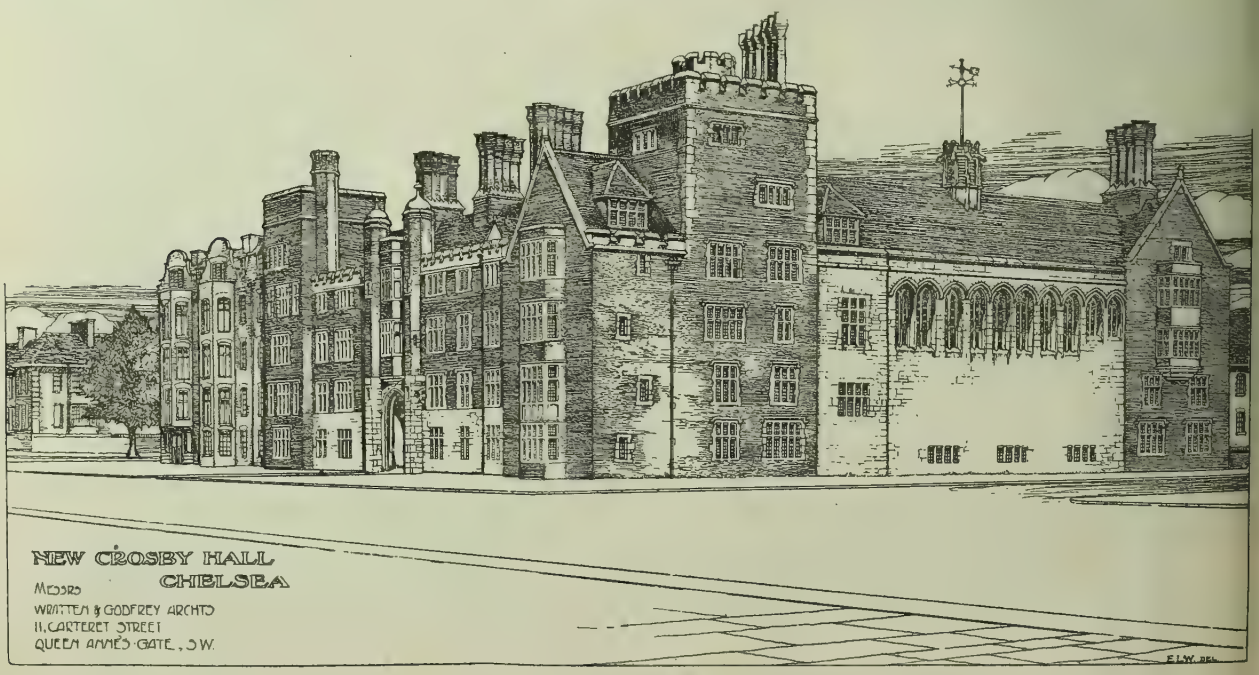
Monument to Sir Wilfrid Laurier.

The Canadian Government has inaugura an open competition for a full-length statue the late Sir Wilfrid Laurier to be erected in grounds of the Parliament Buildings, Otta Designs are to be in the form of sketch-mo in plaster. The author of the selected des will be given the commission to carry out work, and the author of the design pla second will be awarded a premium of 1, dollars. The cost of the memorial and pede is not to cost more than 25,000 dollars. Sendi in day April 3, 1924. Further particulars fr the Secretary, Public Works Departm Room 784, Hunter Building, Ottawa. conditions, photographs and site plan may seen at the office of *The Builder*.)

Holmside Cottage Hospital.

The Holmside and South Moor Collieries in designs for a proposed cottage hospital, c taining one ten-bed ward, two six-bed wa one four-bed ward, and two single-bed wa with operating room, dispensary, offices, acc modation for nurses, &c. The cost is not exceed £12,500. The author of the selec design will be appointed architect for building and awarded a premium of £75; second premium is £50, and the third The assessor is Mr. T. R. Milburn, F.R.I.B Further particulars may be obtained from Joint Secretaries, Welfare Scheme Committ South Moor Colliery Co., Ltd., Stanley, Durham. Sending-in day February 14, 19 (The conditions and site plan may be seen at office of *The Builder*.)

Design for National Theatre.



The proposal for a competition in archit tural designs for a National Theatre will welcomed by people who are interested in su a scheme. An active party in this matter is t Drama League, among whose theatrical exhib at the Wembley Exhibition the winning mo will be placed. The competing architects w have prizes to the value of £400 as their rewa

Formby and Southampton.

Members of the R.I.B.A. are advised to t no part in the Formby Housing and Southa Offices competitions until the conditions h been revised.

Other Competitions.

For competitions open, see our issue November 30.

(*See p.* 913.)

HE ROYAL ACADEMY STUDENTS' WORK

ways one wonders what is behind the s of students and how much or little they o wise guidance and encouragement, so it enter into one's speculations whether the ng qualities of students' work in different is owing more or less to the value of ing and guidance or to the fresh oncoming w talent. But one can hardly fail to e that the special success of this year in tectural work at the Royal Academy must something to the quality of that training which it has been produced. We feel the present year at the R.A. Schools is encouraging from the architect's point of The subject of A Railway Terminus set for the R.A. Gold Medal and Edward Travelling Studentship (£200). Only designs are exhibited. That by John Gladstone Knight obtains the award, and te creditable design it is, the plan being well ut and expressed in a broad, simple manner, h perhaps might have been better without anking pavilions. The entrance front shows sed terrace with inclined roads up on either and, outside these, ascending steps. This ies a certain given condition as to levels. way out is under arches between the two ned entrance roads. The front elevation central pavilion porch having three arched with wide pilasters between : the booking rises as a square outlined mass behind. The lank entrance is for suburban traffic and the flank for Continental. The ascending nce roads arrive on the station level site the end pavilion, so that traffic has to either way at the top and a double turn is ved into the covered ways. There are 11 orms. There is no lettering on the plan ative of the ticket windows. No. 135 is re interesting looking design, but is lacking iietness and breadth. It is illustrated by eful set of drawings but a very poor per- ive. The plan is a clever one and the many t office windows are clearly shown. No. 136 promising design, nicely presented, and some s of it would come very well. The plan ests inadequacy of convenience for so large ation. An admirable detail drawing is m.

e Landseer Prize (£20 and Silver Medal) to Richard George Cox, whose subject is sign for an art college. The plan shows ont block with back buildings arranged d a semi-circular court—rather a costly e of work. The plan is developed in a sing treatment in English Renaissance in k and stone. Eight designs are exhibited this prize. No. 142, a collegiate school collections of fine art, attached to private land, seems a costly scheme, but it is irably illustrated and for its intrinsic t was worthy of some award. The idea tudents' bedrooms with studios over and ens between is good, but if the bedrooms lower and the gardens wider the gardens t be worth having. For mere quality of portion and a pleasing simplicity No. 145 s well in a design for an art college in a ate park. The Second Prize, a Bronze al, goes to Alan George McFarlane. Here flanking corridors, with students' quarters one story only, with gardens between, e a good feature. The whole treatment his design is good and not extravagantly y. If the feeling which inspired it is ine and lasting the student should go far. 141, design for entrance to a public park, ood and the student who has done this is y one of promise. Nos. 140, 143, 144, and have also distinct merit.

r drawings of an architectural design the first e (£10 and Silver Medal) is won by Basil riott, who has an agreeable, well-proportioned aissance design with flat-pitched roofs. The nd place (£5 and Bronze Medal) is by Herbert Horsley Williams, whose sub- is a cloister to a monastery showing nice ing and good proportion. Also shown are . 160, 161, 159, 158, 156, 155, 154, 153, 152, 151, 150, 149, 148, 147. The latter, (though it is Gothic !) deserves note, for its author knows something about proportion, mass and distinction ; we confess we should like to build it. No. 151 really deserves some special mention for it exhibits knowledge and feeling both in design and drawing. It is rather difficult to realise such good work emanating from a lower school.

Perspective drawing in outline of St. James's Church, Piccadilly, is represented by one exhibit —that of the pendrawing by Alan George McFarlane—the best in this subject we have seen for a long time. The centre of vision is not in the centre of the subject, which, as a rule, is preferable. A note on the well-drawn outline perspective points out that the tower and spire are actually 3 ft. 6 in. out of plumb, but are shown as though actually plumb in the drawing.

The Set of Architectural Drawings Prize goes to Ronald Owen Vine. His drawings of the Church of St. Giles-in-the-Fields are neatly drawn on nine sheets.

The Bronze Medal is won by Alan George McFarlane. His illustrations of St. Leonard's Church, Shoreditch, are very delicately drawn.

The competition for the Landseer prize for a draped figure cartoon is rather disappointing. The selected drawings are vigorous, but when one thinks of the beauty which has been got out of drapery they seem to fall short.

In sculpture we find four prizes secured by women. The £200 Scholarship is won by a quite admirable piece of modelling by Daphne Mayo. No. 131 is a charming figure and very excellently draped. No. 133 is very good work.

The subject of pottery in decorative treatment has met with a poor response. As to most of the other subjects—landscape, historical painting, &c.—it is certainly a poor year. It is rather sad to see so much effort devoted to painting with such poor results. One would think it wiser to discourage if it is impossible to guide.

Annual Prize Distribution.

The annual distribution of prizes to the students of the Royal Academy of Arts took place on Monday evening. Sir Aston Webb, President, presented the awards as follows :—

Historical Painting (A Festival), R.A. Gold Medal and Edward Stott Travelling Studentship (£200) : David Shillingford Paynter.

Composition in Sculpture ("The Prodigal Son Received by His Father"), R.A. Gold Medal and Edward Stott Travelling Studentship (£200) : Daphne Mayo.

Design in Monochrome for a Figure Picture ("St. Michael Overcoming Satan"), Armitage Prizes, 1st (£30) and Silver Medal : Olive Grace Bourne. Other prize not awarded.

Design for the decoration of a portion of a public building (Pottery), 1st Landseer Prize (£30) and Silver Medal : Thomas Douglas England ; 2nd Landseer Prize (£10) and Bronze Medal : Cicely Honor Howard Mercer.

Design in Architecture ("A Railway Terminus"), R.A. Gold Medal and Edward Stott Travelling Studentship (£200) : John Cyril Gladstone Knight.

Set of architectural drawings (An Eighteenth Century Building), 1st Prize (£10) and Silver Medal : Ronald Owen Vine.

An architectural design, 1st Prize (£10) and Silver Medal : Basil Marriott ; 2nd Prize (£5) and Bronze Medal : Edwin Herbert Horsley Williams.

An architectural design, Landseer Prize (£20), and Silver Medal : Richard George Cox.

There was no competition for the prizes for Model of a Design, Model from the Antique, and Design in Relief. The prizes for Landscape Painting (Turner Gold Medal), Two Paintings of a Figure from the Life, and Portrait Study of a Lady in Evening Dress, were not awarded.

In the course of his address to the students, Sir Aston Webb said he would speak of drawing first because it was the primary requirement of every artist. In reference to the drawings he had seen he would say that perhaps too much attention had been given to fragments of the figure rather than treating it as a whole.

In regard to the competition for a design in architecture, although they had been given a fine modern subject (A Railway Terminus), he could not say that the designs exhibited came up to what was expected for a design of a terminal railway station. It should, surely, be severe, dignified, and impressive. It was a modern subject, and asked for modern treatment, but that was no reason why it should not be founded and developed on an English tradition. However, the school work, under the care of the Visitors and Mr. De Gruchy, was in many cases excellent, and based on a thoroughly sound English manner. Generally it appeared that the work of the School had recovered from the disturbance of the war, and would soon be normal again. He would impress upon them the necessity of doing their bit, whether in painting, sculpture, or architecture. It had been said that art was at a low ebb at the present day. If so, all the more chance for the students. All art must express itself in a great and natural way, but that was not enough : it must also express itself as their ideal of what was noble and beautiful.

In conclusion he wished them a happy holiday, and hoped that when they returned they would keep high the standard of art, so that they could stand before the world and not be ashamed.

BRITISH MUSEUM LECTURES.

A very interesting account, further revealing the characteristics of Cretan civilisation, founded on the discoveries mainly of Sir Arthur Evans at Knossos, was given by Miss Clare Gaudet at her last lecture. They were a trading and commercial people, in communication with the other civilisations of the time. 1900 B.C., with a fully developed script, but unfortunately undecipherable, no key having been found for it. Their goddess Rhea, the native goddess, was Ishti in Mesopotamia, and is the same goddess under other names in different places, such as Egypt. The Neolithic Cretan walls were of wattle and mud ; later they used stone, strengthened with timber, the inside walls being brick, the surface of the stone covered with a cement composed of a fine-powdered gypsum. The roofs were composed of mud and reeds, and smooth stone was used to strengthen the angles of the walls, and later the whole building was faced with stone. When the windows of the houses did not face on to a square interior court they used wells for lighting them. The windows were glazed with skins dyed red, and the houses contained from six to eight rooms, with internal water supply and drainage up to the second floor. So narrow were the streets they could only be used by pedestrians, no beast of burden being able to pass along them. There was probably a market inside the city, but the beasts appear to have been unladened outside. King Minos, who is the famous Cretan by tradition, gave them their laws, like Khummuabi and Moses, direct from God. The royal tombs have unfortunately been used as quarries even down to recent times, as in Egypt. The palace of Knossos is dated about 1800 B.C., and was built on an earlier structure dating from 2001 B.C. The workmanship of the Cretans is considered to exceed that of Egypt, from whence it came, and photographs were shown by the lecturer of a beautiful ivory goddess equal to Greek or Gothic work.

Architectural Students' Pantomime.

On December 20, at 8 p.m., the students of the Architectural Association will perform at King George's Hall, Tottenham Court-road, a pantomime entitled "So This is Architecture." Seats, 7s. 6d., 5s., and 2s. 6d., to be obtained from the A.A., 34, Bedford-square, W.C.1. All profits will go to the Architects' Benevolent Society.

CORRESPONDENCE.

Architects and Advertising.

SIR,—Some years ago I intervened in a debate at the R.I.B.A. to express the view that architects do not enter the profession for their health but in order to make a living. The Chairman, a distinguished professor of architecture, agreed with me, but deprecated such a statement being made in public. I remain of that opinion and am pleased to find that Mr. Robson is of the same mind on that point. I am known personally to hold some advanced views on the question of professional publicity, but I am hopelessly out of date compared with Mr. Robson, who advocates the professional card system of advertising for architects, a method of publicity long ago adopted by some architects and other professional men in America, Canada, New Zealand and other countries, apparently with the knowledge and consent of the professional bodies concerned. I am not expressing any opinion as to the desirability or otherwise of this form of professional publicity, but it is apparent to me that for some years past, and particularly since the Armistice, there has been a feeling among many architects—noticeably those seeking to establish or re-establish themselves in practice—that modern conditions are such that some better means of getting into touch with potential clients than those at present recognised as customary are essential. Does it not seem that the time has arrived when the whole question of professional ethics in the architectural profession should be reviewed in the light of the present conditions and future prospects, and that some effort should be made to standardise the regulations of the various architectural bodies not only at home but also abroad on this matter. If this is thought too ambitious at present, we might set our own house in order as a beginning so far as professional publicity is concerned, and I would throw it out as a suggestion that the architectural educational conference to be held in 1924 might provide a suitable opportunity for further ventilating this question. I know from personal experience exactly the difficulties which both Mr. Overy and Mr. Robson as country practitioners have to contend with. These exist also in the larger centres, even if they are not quite so apparent, and while they do not seriously affect the leaders of the profession, they present a real and serious difficulty to the average architect, who forms the bulk of the profession. It is a matter which is the concern of all the architectural bodies, and one which can only effectively be dealt with, in my opinion, by co-operation.

C. MCARTHUR BUTLER,
Secretary, Society of Architects.

Camberwell, Past and Present.

SIR,—Strolling down Peckham-road on a dull and misty afternoon recently I noticed on one side of the road the Church of St. Giles, one of Sir Gilbert Scott's early works, and, opposite, the vicarage he designed about the same time; then, near the church, the buildings of Wilson's Grammar School. Returning to the north side of the road there is the Town Hall, designed by the late Edward Power, and then the Passmore Edwards Art School, &c., designed by Mr. Maurice B. Adams; adjoining, on the east side, is the useful building designed by Messrs. George and Peto. This building has just been occupied by nearly six hundred most interesting oil paintings, water-colours, prints and drawings of all kinds relating to Camberwell, Past and Present. A very large number of drawings, &c., illustrate the Church of St. Giles from 1750. It is supposed that a church existed in the seventh century. There are a number of works of the greatest interest, showing portions of Camberwell and Dulwich in the olden time, and to those who have known Camberwell, as I have, for over half a century, the examination was a most pleasant study.

In the "Old House on the Green" it is stated that Sir Christopher Wren lived while St. Paul's was in course of erection; later a murder and suicide took place here. The house was taken down in 1850, and a Congregational Church in late Gothic was erected by Messrs. Habershon Bros.

There were a number of photographs of the Mayors of Camberwell and other worthies, with a few oil paintings of some, one of Dr. Matthew Wallis, for long prominent, and another of the late Alderman Sir W. R. Treloar, Bart., who lived many years in the parish.

It seems a pity that this exhibition was not well advertised, as many a man of antiquarian tastes would have been delighted, as I was, to spend a time in these very interesting surroundings.

HENRY LOVEGROVE.

[*** See Note on p. 918. ED.]

"Frozen Music."

SIR,—It may interest you to know, with reference to the article by Mr. Robertson on "Frozen Music" in your issue of December 7, that in 1921 I submitted a sketch design to the authorities concerned for a new programme and syllabus cover for the series of concerts referred to in the article.

After months of silence I called in to see what was being done. Apparently my design and letter had just been unearthed from office debris the day before my visit, and I was told as politely as possible that the present designs were considered quite satisfactory, and no alteration, therefore, was intended. The programme design is even worse, I think, than that on the syllabus, which I discovered is meant to represent the façade of the building in which the concerts are given. A base was originally in the design, but this was "removed" to make room for some printing.

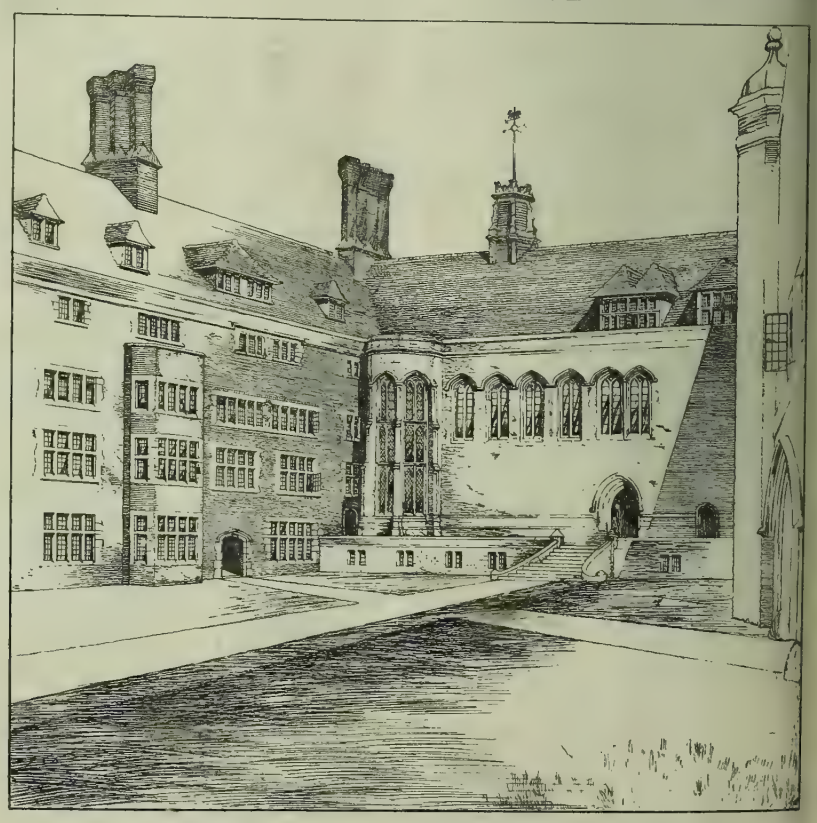
It is time something was done to educate public opinion on such matters. That the so-called "art lovers" who go to the concerts should tolerate such monstrosities makes one wonder whether English people are really interested in art at all.

ARCHITECT.

Charlatans and Pests.

SIR,—It is because the medical professio registered that it has a monopoly of med work and can dictate the terms on which members can accept public appointments. architectural bodies can exercise control their members within the limits of their pow but there is no machinery by which the pro sion as a whole can take action, nor is there architectural body endowed with authority regulate it. When architects have a Regis tion Act, or when the members of the sepa architectural bodies become absorbed into society armed with statutory powers, then profession can act and can practically secure monopoly of architectural practice for members.

I suggest that the Society of Architects moving in the direction indicated by Mr. Ov by endeavouring to bring about Registration. to holding its own with other professional bod I have not heard it suggested that the Soci is backward in this respect, but there is a rum that the Society is regarded in some quarters a leader rather than as a follower in the field architectural activities.



C. MCARTHUR BUTLER

Can Tarnishing be Prevented?

A CORRESPONDENT writes:—

"SIR,—A building recently erected in t town is being used as a workshop and sto and it is found that silver articles, altho wrapped in cotton wool, tissue paper, a placed in cardboard boxes, in a very short ti tarnish rather seriously. There seems to no apparent reason for this. The articles question are stored away from the walls on t first floor.

"The following is a brief description of t building. It consists of four floors. The grou is of concrete finished in cement; the oth floors are timber, lathed and plastered on t underside. The outer walls are hollow bric work. The walls internally have struck joi and are distempered. The stairs and landin are cast concrete. The windows are ste There are no flues, but the heating is effect by gas radiators. The electric lighting h lead covered wires run on surface and stapl to the brickwork."

Crosby Hall. (*See p.* 913.)

CHISWICK.*

In this scholarly and fascinating "essay in historical narrative," Mr. Warwick Draper has embodied the accumulated local knowledge of years of discriminating and sympathetic research, as he prefers to say, the work has been composed "in the margins of days given to following a profession which in great part consists of collecting and sifting evidence for discovering Truth." The book, however, is not, as the above remark would imply, a merely careful record of historical and significant events and facts, but is a continuous history, full of life and colour, of "the pleasant village of Chiswick," as it was described in 1705 by its first historian, John Bowack, invested moreover with a singularly human and kindly charm. The author is no mere picker-up and compiler of dry-as-dust trifles. As he remarks, "It has taken just three centuries to get away from the type of antiquary portrayed in good Dr. John Earle's 'Mico-cosmographie' of 1628 as one who loves all things (as Dutchmen doe cheese) the better for being mouldy and worme-eaten—a great admirer of the rust of old monuments, and reades only those Characters where time hath eaten out the letters—and loves no Library but where there are more Spiders volums than Authors, and lookes with great admiration upon the Antique work of Cob-webs.'"

Although this unprofitable type of antiquarianism may not be wholly extinct there is, happily, a growing tendency to regard the works and history of past times from the broader and healthier standpoint of the sociologist. In this thoughtful modern spirit the author has approached and completed his task and has, moreover, added to it a rare appreciation of the varying significance of the events chronicled and of the relative importance of the interesting and, in many cases, brilliant personalities who pass before us as the tale unfolds. Their characters and qualities are sketched slightly but so brilliantly and with such kindly understanding that they become very real and seem to live and move again in the glamour of their respective periods, with the river they knew so well how to use as a setting background.

The value of such books in enhancing civic pride and securing a fuller and juster appreciation of the things that really matter in our more complex and possibly less attractive social order cannot well be over estimated. Following a suggestive sketch of Chiswick from prehistoric to Roman times, supported by such abundant evidence of early occupation as is afforded by the Layton collection of early relics in Brentford Public Library, definite history begins in 1103 and the narrative, enriched with vivid pictures and incidents illustrating the life and manners of the times, is continued through the Middle Ages, the Tudor period, the great Elizabethan age—with its splendour of life and pageantry—the Stuart and Restoration periods—the great building times in Chiswick—the Georgian era—with "the lustrous artificiality of the Burlington time"—down to our more prosaic and less busy day.

Perhaps the most tender and charming chapter is that devoted to the Plantagenet period. Herein, for the first time in local history, the young King Henry VI is recorded as holding Court at Chiswick for a few years from 1441. Later Prince Henry (James the First's eldest son), who, in 1604, occupied the Palace at Richmond, is referred to as a familiar and admired figure at Chiswick.

The author is obviously a well-informed and appreciative writer upon architectural and town-planning matters, and the illustrations even include many plans and views of fine old houses, most of them long since demolished. The book, therefore, should be of interest to architects to whom the section devoted to a very complete and competent description of the Earl of Burlington's great Palladian Villa, referred to as "one of the most beautiful things in the London area," should specially appeal. The villa and its wonderful gardens are very fully illustrated by plans and views, including some hitherto unpublished drawings by an unknown French artist of 1745, now at Chatsworth. In the chapter on "Modern Chiswick" a very interesting account is given of the creation of the residential quarter of Bedford Park, which was founded in 1875 by Jonathan Thomas Carr, as "a timely protest against the ugly and tasteless housing of the time." With the help of Norman Shaw, E. W. Godwin and E. J. May, several hundred houses were built, together with a club house, the "Tabard Inn," and stores. Now that so much is heard of garden suburbs and housing schemes it is as well to be reminded of this pioneer work of nearly fifty years ago.

A chapter is given to Strand-on-the-Green, which has lately received considerable attention, and of which more may possibly be heard; it is described as having still "a real beauty of its own, the result, on an attractive river bank, of one hundred and fifty years of building and life of which its residents and a wider public are properly jealous."

The activity of the Chiswick Civic Association or their forerunners in averting the destruction of the Duke's Meadows by the erection thereon of gas works and other disfigurements is referred to, and, in outlining the proposals for laying-out this great area for public purposes, the author expresses the hope that "a scheme so large and permanent may be made as worthy in design as the best available skill can ensure." How far this is likely to be achieved as a result of the recent competition for designs architects may judge for themselves. The book itself is admirably produced, very fully illustrated, well printed on good paper and its pages enlivened by the imaginative and highly decorative chapter-head and tail-pieces designed and drawn in line by the author's son, Mr. Christopher Draper, who is also responsible for the coloured frontispiece.

* *Chiswick*. By Warwick Draper, M.A. (Philip Allan & Co., 1923.) Price 25s.

Window for Holy Trinity Church, Woodford.

Designed by Mr. E. Liddall Armitage.

THE PARTHENON, ATHENS.

Sir Banister Fletcher, in a recent lecture on the Parthenon, Athens, at the Central School of Arts and Crafts, reviewed the historical events and the final victories of the Greeks over the Persians, 480 B.C., which led to the building of this temple. Pericles, the great administrator, then determined to give material expression to the national exultation by erecting a votive temple to the champion goddess, Athena, who had given them the victory, and architecture and sculpture were called to the service of the State. The Acropolis rock at Athens, no longer wanted as a military fortress, became the enclosure sacred to the gods.

The lecturer referred to the crystal marble, from which it was possible to call forth the delicate and exact forms so specially characteristic of this Doric temple. Thus could architects and sculptors create the harmony and symmetry of design in column and architrave, roof and pediment, moulding and ornament, frieze and metope, colour and sculpture, which went to the making of the Parthenon. By the aid of lantern views the lecturer described the details of the Panathenaic frieze of the procession, which vibrates with Athenian life. Knights and musicians, priests and youths, matrons and maids, cavalry and chariots, magistrates and gods—all took part in presenting the new "peplos," or robe, to the maiden goddess, guardian of their city.

Bartholomew-the-Great: Limits of the North Transept.

The authorities of St. Bartholomew's Church attempted, during the work now being carried out at Cloth Fair, to discover remains of the north transept of St. Bartholomew-the-Great, which served as the Parish Chapel. In his grant to Rich three years after the suppression, Henry VIII said that the Parish Chapel had been "utterly taken away," and that the headstones and timber were being turned to his own use, and sold. This royal assertion is no doubt true, but shafts sunk from the road level have enabled the authorities to fix the limits of the chalk foundations of the transept to the north. The first shaft, sunk to a depth of from 7 to 8 ft., revealed the chalk foundations of the north-west angle of the transept, and a second shaft, at the entrance to Sun Court, disclosed the limits of the transept. At a depth of 4 ft. from the surface a large double capital of a column, dating from about 1145, was also found in a good state of preservation. This is now on view in the church.

EXHIBITION OF DRAWINGS, MANCHESTER MASONIC HALL AND D.I.C. BUILDING.

WE found on visiting this exhibition that contrary to the formerly expressed intentions of the promoters of the Masonic Hall competition, the drawings sent in in this competition were exhibited, and we commend this as a most wise proceeding for it at once removes any dissatisfaction which might have been engendered by the withholding of the designs from the profession at large.

After a careful consideration of the drawings submitted, there is no doubt that the selected design, by Messrs. Thomas Worthington & Sons, is not only the finest solution of the problem but it is so far in advance of any of its rivals that it is almost difficult to make a comparison, and except in draughtsmanship, where Mr. Fairhurst's drawings are outstanding, there is very little possibility of any comparison that is not distinctly favourable.

The first thought that occurs in a quick glance at the designs is that with the exception of the scheme submitted by Mr. J. H. Sellers no design embodies the semi-religious effect in exterior which is called for in a Masonic Hall of the importance of this one. In fact, Mr. Sellers' elevation is the only one of the other designs which can be said fully to portray the purpose of the building. Mr. Sellers' façade has a sense of restraint, scholarship and dignity, and conveys what it is intended to convey, and is only surpassed because the design of the winners has these qualities in a more marked degree.

When the interior principle and planning is considered the superiority of the winning design is still more marked. The impressive character of the approach when one has entered as conceived by the selected design is unequalled. The fine long crush hall, flanked by orders, with the impressive portal at the end of the vista, has no parallel in its rivals. Mr. Sellers again has attempted to gain a proper solemnity in this feature, but is crippled because he enters his hall at an odd point on one side which means that the dignity of his design is not brought home to the entrant until he has reached the centre of the hall and turned to the right or the left. And although we remain of the opinion that the ante room accommodation in the winning design is inadequate this same fault is apparent in all the designs. Taking the designs individually, they all have interest, although strangely the remaining designs reflect a commercial spirit which is inconsistent with the purpose of the building.

One must notice the set of drawings submitted by Mr. Harry Fairhurst by the beauty of their finish. The draughtsmanship and colouring of this set of drawings, as we have remarked, is outstanding, but from a practical point of view the plan fails from lack of realisation of the needs involved (perhaps Mr. Fairhurst is not a Mason) and in design, because the elevation suggested is more fitting for some dignified civic or government building for which it would be suitable and distinguished.

Messrs. J. W. Beaumont & Sons contribute an interesting design, but the treatment again is somewhat commercial.

The same remarks apply to the design of Messrs. Barker & Hoyland, who have emphasised their banqueting hall.

The D.I.C. Building.

The assessing of this competition must have been much more difficult than the last; there are at least three designs all of which have great merit, and a fourth which calls for attention imperatively.

The winning design, by Messrs. J. C. Prestwich & Sons, is an excellent one, and it gains much by the excellence of the drawings. The large elevation and perspective are delightful examples of conscientious draughtsmanship. From the practical point of view the scheme certainly seems to combine both excellence of plan and suitability of conception, both to the purpose of the building and appreciation of its surroundings.

Mr. Harry Fairhurst (commended) submits, as usual, a delightful set of drawings, and it was must interesting to consider his design in view of the fact that the D.I.C. building is to be next to his own well-known Manchester Liners building. Mr. Fairhurst may always be relied on to give an indication of the trend of the best thought in current architectural problems as relative to commerce, and his treatment of the shops at the base of the building is well worthy of note, where he has contrived to get ample light and window space without neglecting the æsthetic need of a suggestion of solidity in a building of the great weight of the one in question.

The design of Messrs. G. H. Willoughby and Messrs. Rees & Holt (commended) also give a most interesting solution; and Messrs. Halliday, Patterson & Agate offer an elevation at once suitable and elegant.

After an examination of the drawings one can only wish that such exhibitions were more frequent. From the comments of the public who were present on the occasion of our visit we feel sure that a great deal more interest, and furthermore a better informed interest, would be cultivated in the public if they had the advantage of seeing more of the architects' not at all unimportant work in the modern world.

CAMBERWELL, PAST AND PRESENT.

THIS was the title of an exhibition held at the South London Art Gallery, Peckham-road, S.E. In the foreword to the catalogue it says: "A century ago Camberwell was the dwelling-place of men of letters; nightingales sang in its copses; and coaches rumbled from town to peace and quiet and to leaf-hidden homes." David Cox, the famous water-colourist, resided at Dulwich, and here he made many drawings. A wooded walk still remains which is known as Cox's Walk, and it will probably come as a surprise to many to know that in College-road a turnpike is still in existence levying charges on vehicles using the thoroughfare. In this district—within four or five miles of Charing Cross—farming is still carried on. Dulwich Village still retains much of its old-world beauty; many old Georgian houses are still surviving, and some fine old wrought-iron gates. The locality teems with places of interest, and it is remarkable that so much remains in these days of ceaseless demolition. Numerous celebrated persons resided in the district. The prints, drawings, and water-colours are a fine representative collection, and help one to realise the charm and beauty of Camberwell and district in days long gone by.

GLASGOW SPORTS PAVILION COMPETITION

"MENS sana in corpore sano" is the slogan of the Student Welfare Committee of Glasgow University, and in deciding to erect a new sports pavilion on the Athletic Ground at Anniesland they hope to provide an incentive for the students to improve their bodily health and be the better able to meet the mental strain demanded by their studies.

Designs were invited from architects having an office in and practising within the municipal boundaries of Glasgow. Mr. Alexander N. Paterson was appointed assessor in the competition. In all 16 designs were received, and the assessor has now issued his award as follows:—1, Mr. James M. Honeyman, 194, West Regent-street; 2, Mr. Will J. B. Wright, 170, Hope-street; 3, Messrs. John Burnet, Son & Dick, 239, St. Vincent-street.

Mr. Honeyman's design, which we publish this week, is carefully planned on simple, broad lines and provides direct lighting to each apartment, a feature which showed a marked improvement on other designs where rooflights had to be used. Another feature is the tea room of 1,180 sq. ft., with partly covered balcony giving a direct view of the principal playing pitch. The general finish will be of the simplest nature. The elevations are kept on straightforward, simple lines. The main entrance is accentuated by a flight of steps to covered portico and dominated by a prominent gable. The roofs are tiled with a mixed combination of red. The construction to be fire-resisting throughout. A flat breeze concrete roof finished with asphalte is placed over two dressing-room wings.

The heating is to be on the low-pressure hot-water system with rapid circulation and is divided into sub-circulations, each under control. Radiators are placed in the window breasts in the secretary's room, entrance hall, lounge and tea toom. The dressing-rooms are to have a 2 in. malleable iron coil pipe with galvanised iron clothes rack surrounding. The drying rooms to have powerful pipe coils on the wall, and under separate control. Two ventilation flues have been provided with fans and duct leading to same as shown on plans. Ducts are also provided in ablution rooms in basement to accelerate the removal of vapour during humid weather. The lounge ventilates over a false ceiling in the passage behind. The hot-water source will be centrally controlled by an independent boiler and large circulator, to ensure an ample supply of hot water. The hot-water will be fitted with a return and work done in the usual approved manner.

The building will be lit with electricity throughout. Allowance is made for 85 lighting points and switches.

The total cost of the work including roads and paths, architect's and measurer's fees, is estimated at £10.000.

Farm Buildings at Dulwich: Shortly to be Demolished.

LIVERPOOL ARCHITECTURAL SOCIETY.

"OUR CLIENTS AND OURSELVES."

On December 11, at an ordinary meeting of the Liverpool Architectural Society, Mr. Herbert A. Welch, A.R.I.B.A., read a paper on this subject, in the course of which he said that there never had been a time in the history of their art when better facilities for art and constructional training had been available to the student. This had already resulted in a great advance in the general level of modern architecture. That this general level would attain to even greater heights he had not the slightest doubt. By this, however, he did not mean that he was entirely satisfied that the present method was quite the best which could be evolved. He looked forward to the time when the system at present adopted in the schools would be supplemented by, or dovetailed into, fairly lengthy periods spent by students in the offices of practising architects, whereby they would be enabled to get more closely into touch with matters of practice during the more impressionable period of their training. In his opinion they had yet fully to realise that their profession called not only for a high level of artistic and scientific attainment, but—what he thought to be equally important—a fair measure of business ability.

Side by side with this advance in training the public was at last taking a more enlightened interest in their art. The reason was not far to seek. They had become more worthy of their interest. Their work, in fact, began to arrest. Even so the average citizen did not fully realise the range of beneficial advice and help that was available to him or her from the properly qualified members of their profession. The ethics of their profession precluded them from making use of public advertisement in order to enlighten and instruct the public. This he considered in the main to be a good thing, as it left their clients as the only medium for the circulation of such information. Such a medium must of necessity be slow, but he was inclined to think it had the advantage of being sure. It therefore behoved them to render to their clients the best service in their power.

He considered it manifest that by far the greatest difficulty was at the start, and when he said that their first clients were amongst their most cherished recollections he thought he expressed the feelings of all those architects who had stopped for a moment in their busy lives to take a retrospect of their careers. The courage of those who trusted them and placed themselves in their hands before they were able to point to any practical accomplishments, was something for which they should be grateful, and of which they had a right to be modestly proud.

Good architecture being uppermost in their minds, they had to apply themselves to finding the best architectural expression of their client's desires. They must not be nervous of discussing with them this aspect of the problem. All clients appreciated a building of real distinction, even if they did not technically understand the true relation of the component parts which go to the making of such a building. From the first their efforts should be designed to get a full understanding of their clients, to which end they should be frank and confidential. It would generally be found that these qualities were appreciated and readily reciprocated. They must remember that their clients placed in them great confidence, in addition to a heavy responsibility in spending to the best possible purpose large sums of money. It was for them to justify that confidence by producing a building in every respect suited to its practical purpose—economical (but not mean), dignified, and possessed of such distinction that it arrested attention. This accomplishment would be a source of satisfaction alike to the owner, to the public and to the architect.

When first consulting an architect clients frequently exhibited a tendency to understate the amount they were prepared to spend upon the proposed work, feeling that they might produce a more costly scheme; and, as business men, they considered it wise to reserve to themselves a margin for safety. They should always frankly request clients not to do this, for two special reasons. First, it was an indication that they were not sure of them, and second, such a method was liable to result in the production of a design less satisfactory for its purpose than might otherwise have been the case. If, however, their clients stated a sum which was inadequate for the purpose, it was wise tactfully but frankly to say so; it secured both themselves and their clients against subsequent disappointment and possibly bad feeling. Having then persuaded their clients to accept what they thought to be the likely cost of the proposed building, it might shake their confidence if ultimately this sum was largely exceeded. They must, therefore, do their utmost to guard against such an event.

In drawing up the contract they should be at pains to explain to their clients the meaning of its salient clauses, never forgetting to make it clear that it was in the best interests of all parties concerned—client, architect and contractor—that all orders for work should be given not by the client but on his behalf by the architect. Any departure from this established custom was likely to cause discontent and unhappy relations at the settlement of accounts. If such matters were stated tactfully—and not in a high-handed manner—their clients would readily understand that it was their interests alone which they were safeguarding. They should be careful to explain that in the administration of the terms of the contract their main duty was to promote fair play and to hold the scales evenly between the parties. It was desirable, also, to make clear the meaning of their certificates for payments to be made by them to the contractor at various stages during the execution of the work; and on issuing certificates it would be found helpful to notify clients at the same time. Incidentally, on issuing the first certificate they should mention that the contract stipulated for payment of the amount stated within a week or ten days—whichever was the case this helped to guard against a matter of importance being overlooked.

During the execution of the work it was usual, for a variety of reasons, to make variations which frequently involved additional cost. They should notify their clients of these variations and, wherever practicable, give them an approximate idea of the additional cost. Where a quantity surveyor was engaged his help in such matters should be invited.

It was in their clients' interest that their relations with the contractor and sub-contractors should be of a helpful and friendly nature; no good purpose would be served by using their authority in an overbearing and high-handed manner. They should keep clearly in mind that the successful accomplishment of their task depended upon the closest co-operation of all parties concerned. Soundness of judgment, coolness of head and conciliation of manner would generally overcome most of the differences that arose.

Again, in dealing with local authorities, district surveyors, adjoining owners and others, it would generally be found that their requirements and interests could best be met by tactful handling and sweet reasonableness, to the satisfaction of all concerned. By this he did not mean that the architect should pursue a weak policy of giving all and receiving nothing, but rather that when negotiating he should be moderate in his demands, frank and open in manner and transparently honest of purpose.

He would now like to point out where their knowledge and experience might be expected to be put to the test in various other directions. For instance, in acting as assessor in an architectural competition the ability of an architect was very fully extended. Here, again, their clients must take them fully into their confidence. The assessor must fully discuss with them the proposed scheme and clearly ascertain their various requirements as to accommodation and cost. Having proceeded thus far, a wise assessor would as the next step work out in sketch form those requirements in order to satisfy himself (*a*) that the site was suitable for such accommodation—an omission to do this would probably result in the competitors being invited to spend much time and thought upon an impossible project; (*b*) that there was a reasonable prospect of the proposed accommodation being obtained for the intended cost. If these fundamental conditions were not met, the assessor would frankly state so to his clients, and suggest an adjustment of these two factors, in order that they bore a proper relation to each other. In close consultation with his clients the assessor would then proceed to draw up, without ambiguity, the conditions for the competition, making abundantly clear to competitors the essential requirements as distinct from suggestions. If all this preliminary work were thoroughly done their clients would be happy to find the number of questions received from competitors reduced to a minimum, and what was equally important, the competitors would be able to proceed with the preparation of their designs without a long delay for the replies to questions, none of which were likely to be of a fundamental nature. The drawings having been received the assessor would very carefully and deliberately scrutinise each set. In his determination to do justice alike to his clients and to the competitors he would rule out all designs which violated in essential particulars the conditions of the competition. Having arrived at his decision regarding the premiated designs he would present his award. Whether this should be done orally or otherwise was a personal matter, but the award should finally be published for the help and guidance of competitors and, wherever practicable, the whole of the drawings sent in should be publicly exhibited. Such an exhibition created an interest in the locality and was instructive to the competitors.

In addition to the services already mentioned they would probably be called upon to advise upon disputes which had reached an acute stage, and were likely to be settled in the Court or to proceed to arbitration. Regarding cases which appeared likely to be settled in Court, it should be considered as the duty of every architect so consulted to use his utmost endeavours to arrive at a fair and equitable settlement out of Court. By so doing both parties to the action were saved heavy bills of costs and the parties concerned were spared the ill-feeling and recrimination which usually resulted from such actions. Here again a full, frank and open discussion, without prejudice, between the professional experts would generally be productive of a satisfactory result.

When acting as arbitrator they must first study closely the terms of reference and be quite sure that they were clearly set forth in the Form of Appointment. They now had no client, their position being somewhat similar to that of a judge. It was their duty fully to investigate the matter in dispute by calling together the parties concerned, including their witnesses, hear all evidence and examine in detail all correspondence and documents which in their opinion were essential to the case. In order fully to get to grips with the matter it would generally be helpful for them to make at least one early visit to the site, and to arrange for at least one expert on each side to meet them there. It occasionally happened during the hearing that by consent of the parties the terms of reference were varied somewhat or that the time for the making of the award was extended. In either case it was desirable that a solicitor be consulted in order to make such variation accord with legal procedure.

Having arrived at their decision they should be at pains very carefully to make their report and then instruct a solicitor to draw it up and notify the parties in the usual legal manner.

In a profession demanding so wide and varied a knowledge as theirs it was but natural that however much advice they received and however much learning they acquired, mistakes would nevertheless occur.

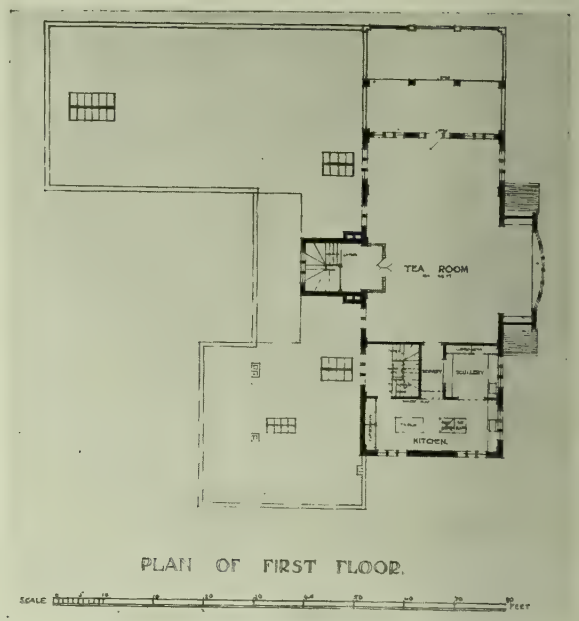
Jedburgh Abbey.

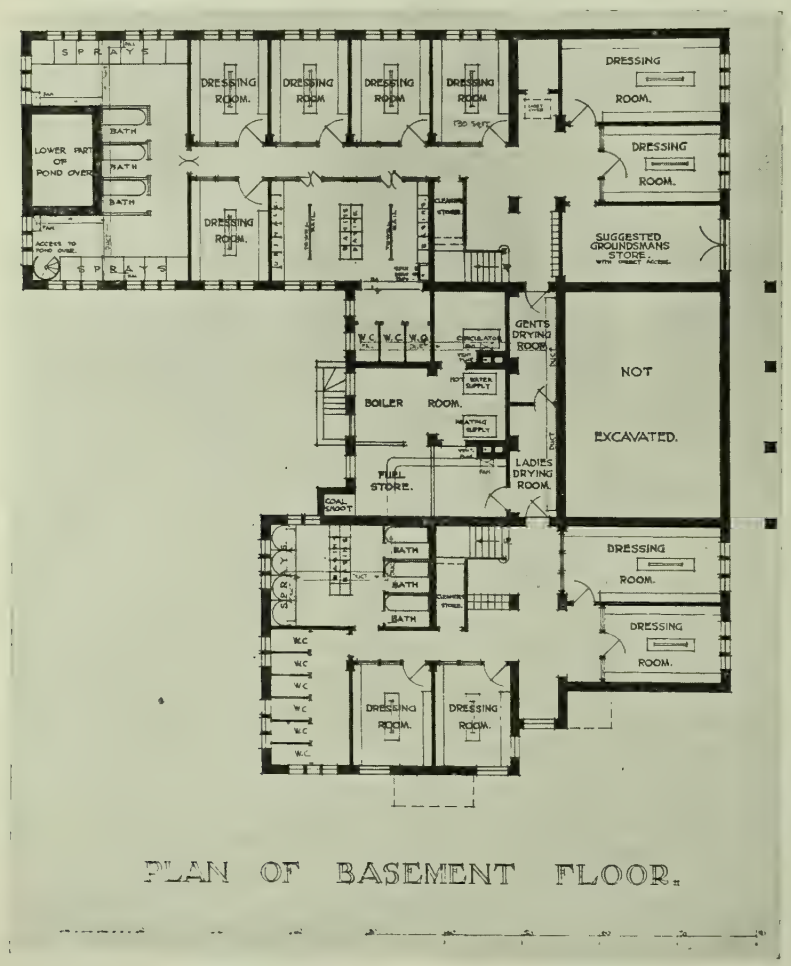
An article on the conservation of Jedburgh Abbey is given on p. 928.

Eastbourne College War Memorial.



Further illustrations and description of the Eastbourne College War Memorial Tower and other additions, by Messrs. Bourchier, Tatchell & Galsworthy, FF.R.I.B.A., were given in our issue for September 1, 1922.

House at Hawton.



This house has been designed for a country site bordering a river and with the main views looking south across the river and surrounding meadows. The outer walls are built of stock bricks with darker facing bricks for the dressings to front door and windows. Rustic hand-made sand-faced tiles were used for the roof. The whole of the woodwork to the living room has been done in oak with special hand-made wrot-iron door furniture. The cooking, a little central heating and the hot-water supply are all worked from a "Thermostove."

The general contractor is Mr. Roland Hill; the electric lighting plant has been installed by Mr. Suter; the central heating and plumbing by Messrs. Thos. Knapp & Sons; the tiling by Mr. A. Wright; the wrot-iron furniture by the Jordans Village Industries, Ltd.; and the steel casements and leaded lights were supplied by Messrs. Geo. Wragge, Ltd.

The architect is Mr. A. Percival Starkey, Harrow.

Glasgow University Pavilion Competition.
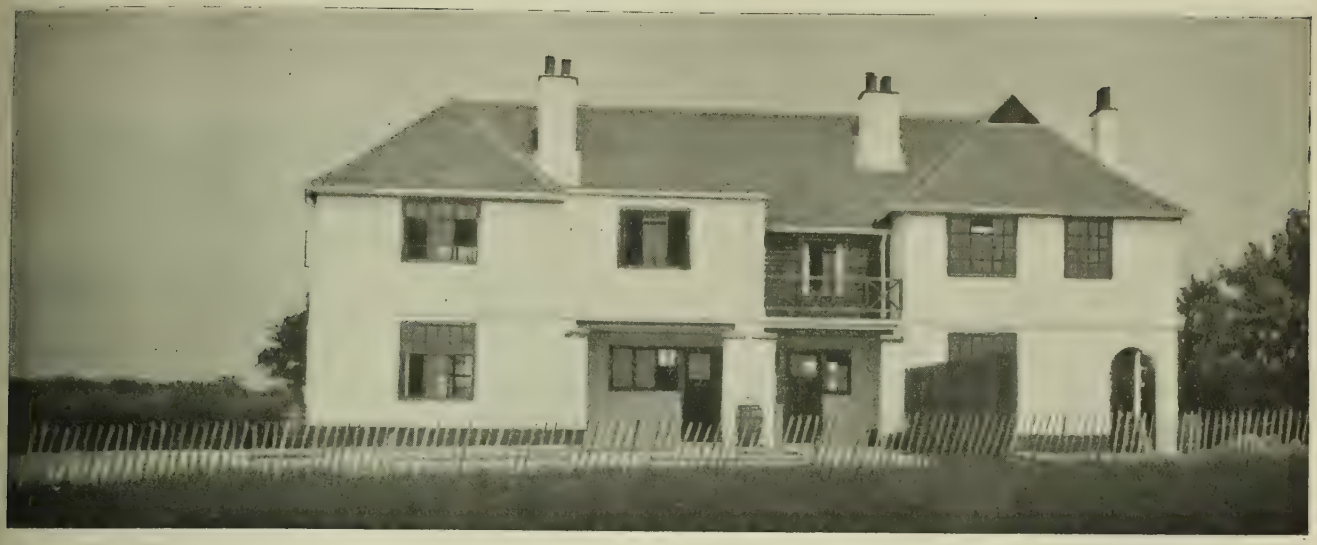
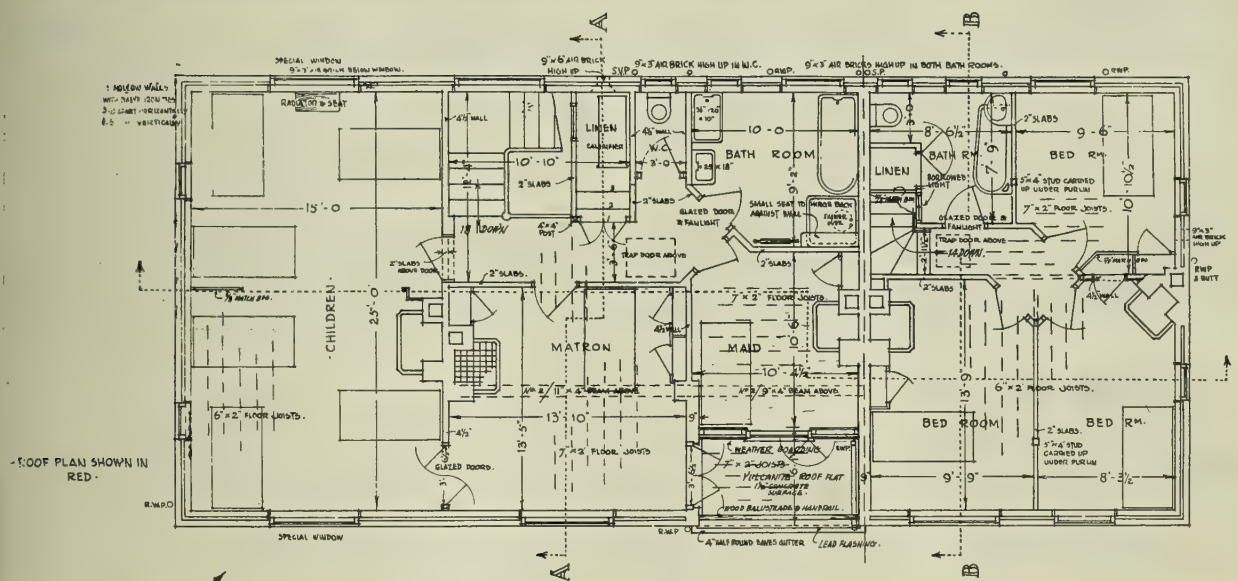
Design Placed First: By MR. J. M. HONEYMAN, A.R.I.B.A..

"Appleshaw," Purley.

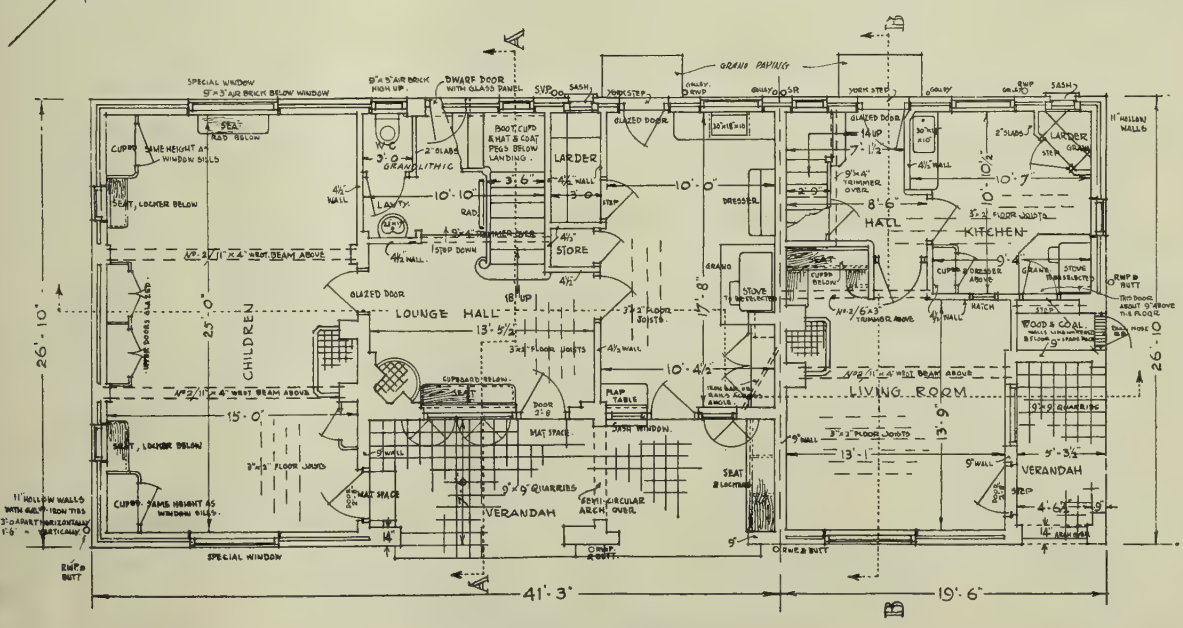
Our illustration shows the entrance front of this house. The building was designed in order that the central portion might be constructed immediately, and that the wings could be added at a later date, each addition leaving a satisfactory building. The materials used have been Sussex stocks with red sand faced quoins, plinth and string courses, and red sand faced tiled roof. Messrs. Ernest G. Allen & Partners, of 11, Arundel-street, Strand, W.C. 2, are the architects.



Tedavenet Church, Monaghan.



Funds being insufficient to build a new church, it was decided to convert the old early nineteenth century church into transepts, and to build across it a new nave and aisles and chancel. A new vestry is also provided. The roof of the old church will be removed, and replaced by a new open-timbered roof, covered with grey-green rustic slates. The aisles will have flat roofs and parapets to economise height.



An attempt has been made to adapt the old Irish Romanesque in the treatment of the problem. Unlike most other Romanesque styles, the Irish round-arched work was usually marked by rather high-pitched roofs, and a characteristic feature was the inclined jambs of roods and windows. Square-headed doorways, with deep lintels occasionally sculptured, were also frequently found in early work. The architect for the new work is Mr. R. M. Butler.

Children's Home and Cottage, Tandridge.

This building was completed in May this year. It comprises one small cottage at the east end, which is let by the owner, while the western and larger portion is intended for and used as a country home for sick children, and is run entirely philanthropically by the owner. It faces due south in an open position with good views. The walls are 11 in. hollow of local stocks painted with the Indestructible Paint Co.'s white "Wallene." The roof is of local sandfaced red tiles. All windows are "Standard" metal casements in wood frames, supplied by Messrs. Hope & Co. A No. 2 "Cookanheat" range is installed in the Home, and does the cooking and hot water supply, and in addition heats three radiators and a towel rail in the bathroom. This installation was carried out by Messrs. J. & F. May. The general contractors were Messrs. Head Bros., of Lingfield, Surrey, who carried out the work under the supervision of the architects, Messrs. Hayward & Maynard, 14, John-street, Adelphi, W.C.2.

SOCIETY OF THE HEMICAL INDUSTRY.

r a meeting of this Society, held in their is at Burlington House, Piccadilly, re- y, Mr. J. Allen Howe (Geological Survey reat Britain) read a paper on "The Use Preservation of Building-stone." Mr. . Fox followed with a paper on "The nical Aspects of Building-stone Decay." r. Howe said that trouble with building-stone been going on for the last hundred years, and two questions that had to be considered : (1) What could be done with building- e to prevent premature decay? (2) What l be done with decayed stone in old and rical buildings in order to put it right? series of lantern slides, which illustrated arious types of limestone, followed; and lecturer then proceeded to show actual nples of decayed stone. Two pieces from rch at Hyde Park Corner were shown. In case, where the stone had laid flat to the grave trouble had arisen; but in the other, result of protection from the rain, little had been done. Water clung, he said, it was with cornices they had difficulties. tone could be made waterproof, these les would not arise. In towns generally, nisms had very little chance against the ur in the air, therefore their effect was gible.

e of the difficulties, the lecturer said, they always up against was the question of right ion; although one could always get a r stone if one paid sufficiently for it. He mentioned the case of one of the piers at Brompton-square—two excellent pieces of Portland stone at the base, but two execrable pieces at the top. Further, there were the sad cases of the Victoria and Albert Museum, Devonshire House, the archway at the bottom of the Green Park, and Buckingham Palace.

Mr. Fox followed and dealt with the effects of weathering. The question of organisms had recently been revived, but he thought that, so far as London was concerned, they need not worry themselves about bacteria; even if they were destructive the action was very slow. It was, he said, questionable whether even the presence of NO_3 meant the presence of bacteria. The main damage in London was due to the action of SO_2 or SO_3.

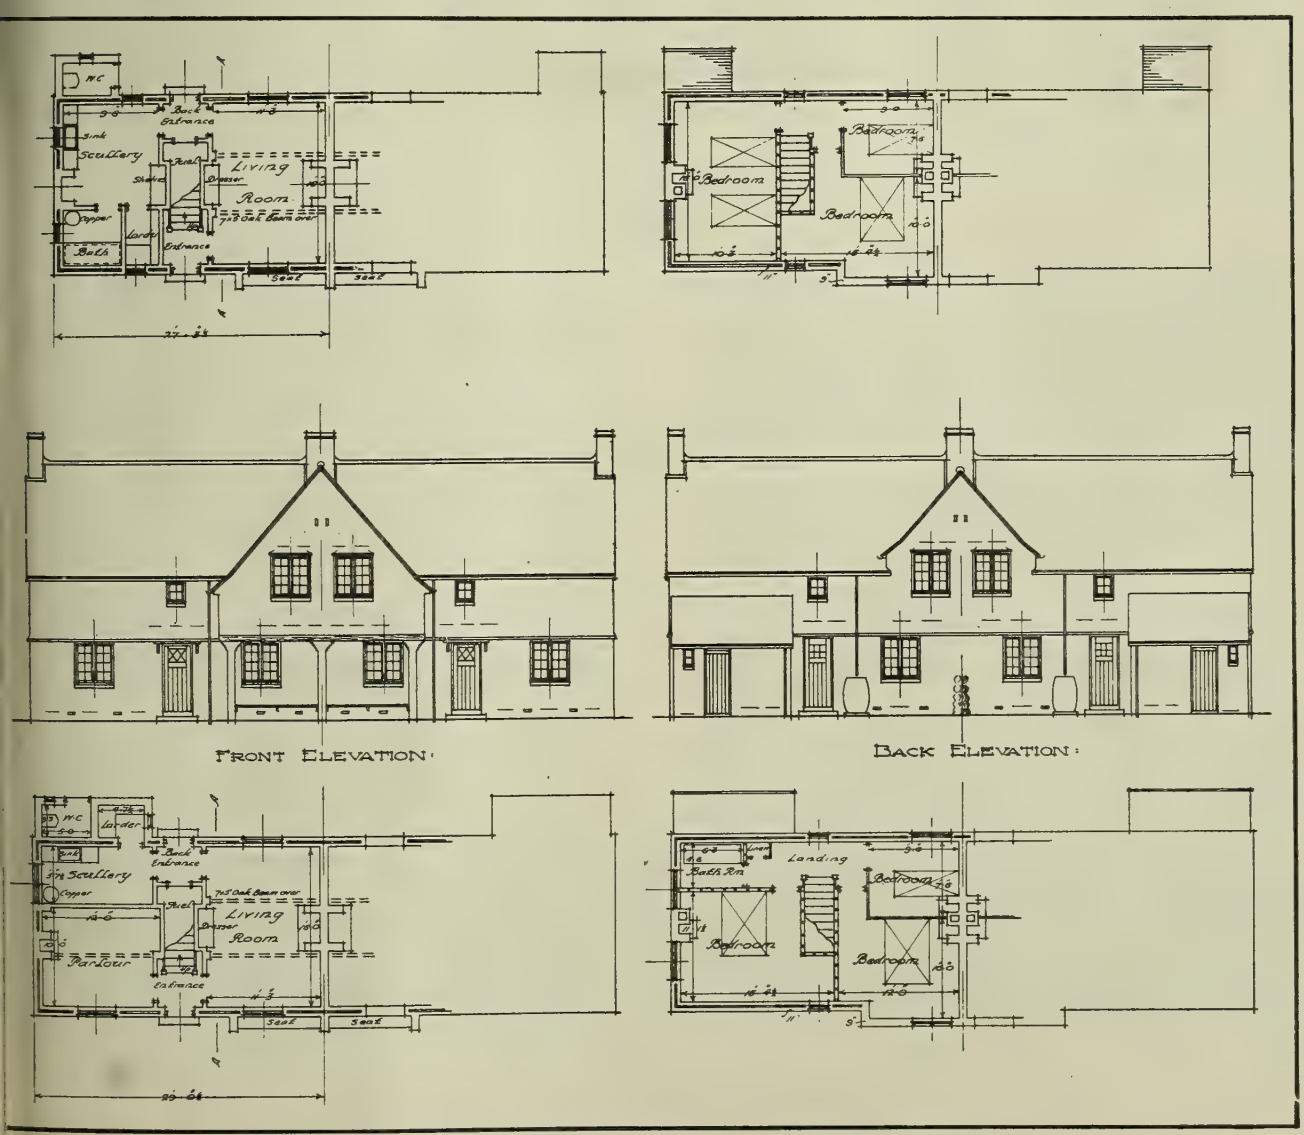
The question of preservatives for stone came under two main headings: (1) They must prevent penetration of moisture, and yet allow moisture to escape; (2) they must not seal in the face of the stone and cause an impenetrable surface.

If stone were treated with preservatives it would be a good plan to place it under observation for a number of years. If so treated, however, it was desirable that the face of the stone should not be entirely altered (the use of paraffin wax, for example), otherwise they might just as well use artificial stone.

The lecturer concluded with the importance of the economic and æsthetic aspect.

In the discussion that followed Mr. Noel Heaton suggested that possibly lichen was the result (decomposition having taken place in the stone) and not the cause of decay.

Mr. A. E. Munby mentioned that the cost of stone varied very considerably, and thanked the chemists for coming to the assistance of the architects.



At the conclusion a vote of thanks was passed to the lecturers.

MOUNT PLEASANT MOTOR GARAGE AND OFFICES.

This building (see p. 926) has been erected and completed for the Mount Pleasant Motor Co. on a corner site in Margaret-street, Clerkenwell, on the Marquess of Northampton's estate. Apart from the offices, repair and paint shops and stores, there is accommodation for about 140 cabs or cars. Advantage is taken of the fall in the ground by providing from Upper Yardley-street a sloping roadway of easy gradient to the first floor. The cost of the work was about £20,000. The contractors were Messrs. Levy & Lester, of King's Cross; the architect was Mr. H. Yolland Boreham, 1, Museum-street, W.C.1.

Royal Institute of British Architects.

On December 17, at 8 p.m., Mr. Raymond Unwin, F.R.I.B.A., will deliver, at the Royal Society of Medicine, 1, Wimpole-street, a lecture on "Higher Buildings in Relation to Town Planning."

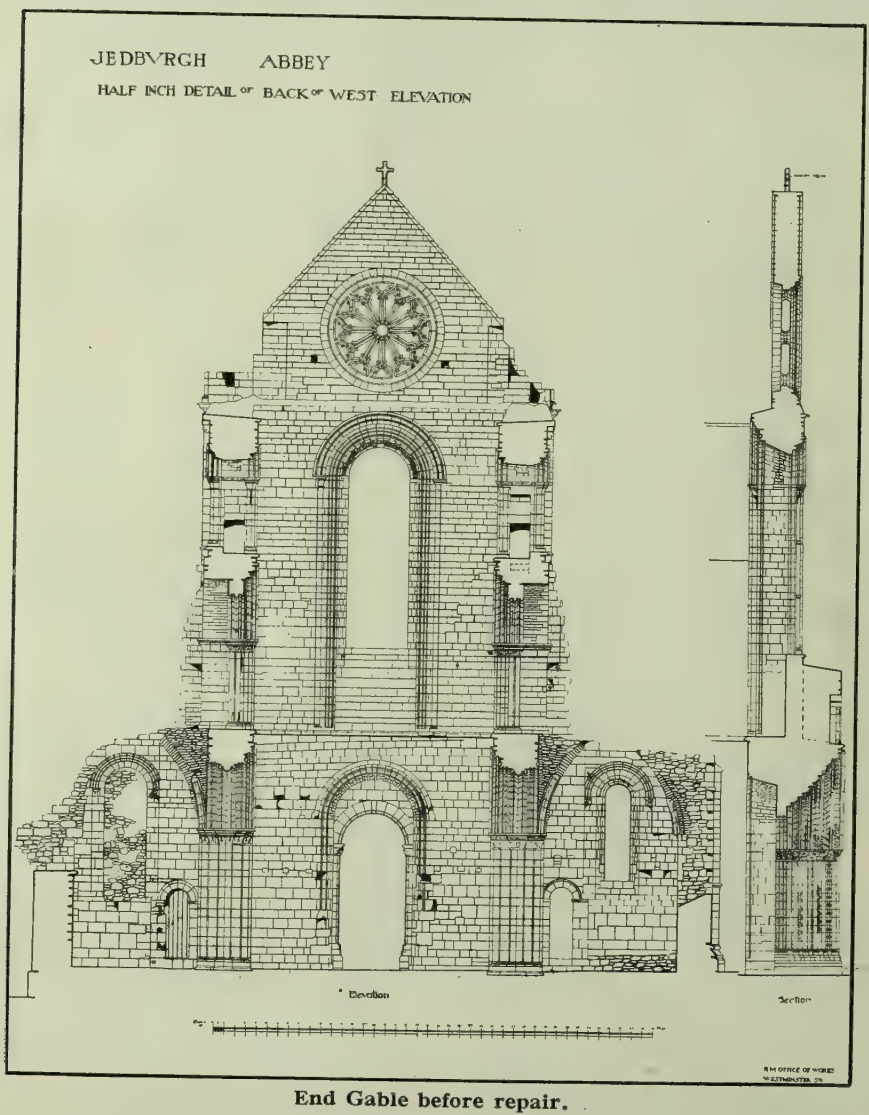
Plans for Government Subsidy Houses. By MR. REGINALD PRICE.

[These plans have been prepared by Mr. Reginald Price, L.S.A., Bridgnorth, Salop.]

JEDBURGH ABBEY.

By WILLIAM HARVEY.

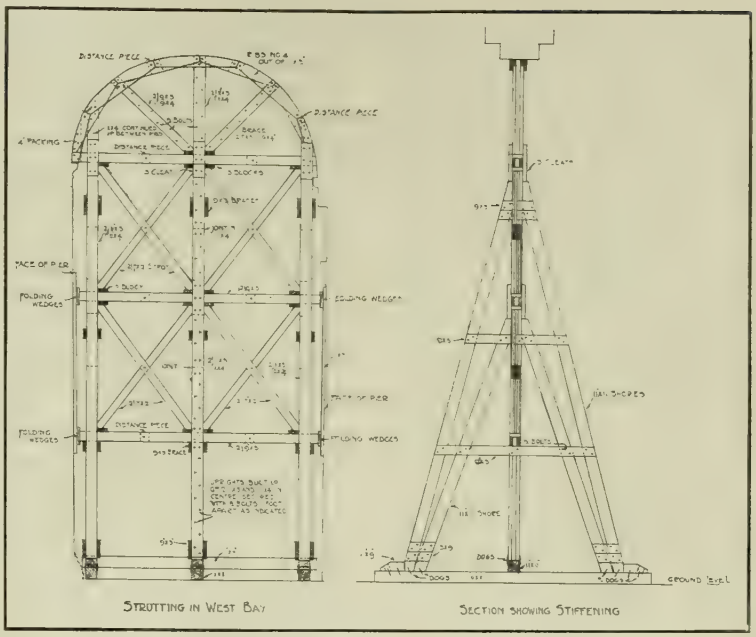
THE art of conserving ruined buildings is admittedly a specialised branch of architecture demanding exceptional training, and, perhaps, something like exceptional temperament in those who undertake the work if it is to be carried out in a thoroughly satisfactory manner, yet it resembles creative architecture more closely than might appear at first sight. In maintaining a ruin the same three considerations have to be faced which confront the designer of a new building. Convenience, construction, and appearance must receive attention together, and, in the case of the ruin, the convenience of the modern students and sightseers who use the building must be thought of in intimate connection with the preservation of all evidences of the original purpose for which it was erected in other times by people possessed of a form of civilisation differing from ours but no less complete in its own fashion. The fact that the building undergoing treatment is a ruin does not in any way remove, or even materially lighten, the necessity for the weighing of alternatives and the exercise of discretion, both as to ways and means to be employed and the effects towards which those ways and means shall be directed. What effect the conservator hopes to create is indeed a vital matter. The ambition of the Revivalist to add new works in the style of the old is no longer looked upon with favour, and conservation is confined within the humbler path indicated by Ruskin, who insisted that any necessary works should be so designed as to be subordinated to the legibility of the history and artistic beauty of the old design. Small, unobtrusive repairs, executed when they were required, were advocated by Ruskin as likely to stave off the necessity of major works, and he accused the French architects of his time with neglecting purposely their ancient buildings in order to bring about their ruin, and so occasion a demand for new works of a nature calculated to bring fame or profit to modern architects and builders.



Over-elaborate restoration, whether brought about by the crafty self-seeking described by Ruskin or by ill-directed generosity, as at St. Alban's Abbey, is contrary to the best ideas of our time upon the subject; the range of effect that the conscientious conservator feels entitled to produce is limited to the various methods of executing the minimum of necessary repair in the least obtrusive fashion.

Entering fully into the spirit of Ruskin's appeal, the Historic Buildings Branch of H.M. Office of Works has created a tradition of repair which permits the beauty of the old work to be appreciated whilst conserving its stability in the most scientific manner. Prior to the formation of this Branch, repairs to ancient monuments, even when developed upon a sound general idea of conservation, were often crude and artless, and inserted in the first manner that came to mind, without any attempt to achieve a general harmony of effect throughout the monuments as a whole. Broken and overhanging masses of stonework were bound about with old iron bars bolted into position, and for this purpose old rail metals had even been used on occa Irregular broken portions of masonry smeared over with cement, obliterating history and their artistic value at a str tie bars and straining beams were inserte connect walls, and incongruous buttresses masses of underpinning were erected to up portions of the building that threatene fall. Even where appearances were sidered, the revulsion from the method Revivalist restoration sometimes led to affectation of honest roughness in the rep and the necessary new work was purp given a character at variance with anyt in the old building in order to avoid deception of anyone who might look at it hurry. While the intention underlying method of repair was sound enough, patches of new work were certain to obt themselves as inharmonious blots, whose ferent colour and texture advertised them threw them into quite unnecessary pro ence, to the detriment of the ensemble.

Jedburgh Abbey, which was handed ove the Historic Buildings Branch on Decembe 1913, had already suffered from rep executed at various times, for which it be claimed that they were all executed styles calculated to produce discord, at s considerable expense of money. The rep certainly had the merit of honesty, since one could doubt that they were modern in tions, but, unfortunately, though evident were far from being efficient. Wall t wall passages, and broken portions of building had been covered with a coat cement rendering which had already bec broken and leaky. The walls of the n were propped apart and stitched together v struts and tie bars whose uselessness mi have been apparent on reflection, since t walls overhang towards the north and w therefore incapable of assisting one anothe any considerable degree. Against the cr bling piers of the tower in the centre of church rude masses of masonry and an congruous buttress arch of brick had b erected, disfiguring their outline and encu bering the space without doing any mate service in relieving them of the excessive l applied to them by the weight of the tov In the light of what has been since achie it is easy to recognise that the former rep were ill-advised, though it is only fair admit that they were executed in a fash that compared favourably with much work a similar character that had been carried on other historical ruins within a short tance of Jedburgh. But, although the sightliness of these repairs may have b relative and subject to personal opinion, th strength was obviously too slight to contir to uphold the monument.



The stonework of the overhanging n walls was wearing away in sandy dust un the action of wind and weather, and the c tral tower was recognisably unsafe, and been condemned to demolition to prevent accidental fall. The Historic Buildings Bra had to face a very serious state of affa By any known method of repair the build could only be upheld by the insertion further props and buttresses, or else molished and rebuilt with the sacrifice of historical interest which constitutes nine-ten of its appeal. If neither of these two cour were chosen there remained the fatal alter tive of allowing the building to crumble its fall, an alternative which, even if it mi be considered permissible in the hands o private owner, could not be seriously c sidered by a body whose duty was the c servation of historical buildings. It beca necessary to go outside the accepted rout of repair and devise a new method that wo satisfy the conditions of stability and artistic suitability while conserving the ve able shape and material of the ancient bu ing.

The application of cement grout to the terior of old walls had been recommended

End Gable before repair.

her cases, and it was hoped at first that by e use of the grouting machine the demoli- n of the tower could be avoided. Rumour edited the grouting machine with almost pernatural powers of forcing strengthening ment into the interstices of old core and in rtain cases, where the core is formed of an dry stone and where adequate pressure n be applied, the machine is of great value. here is always the risk, however, that ough cement may be forced into the body the work it may fail to adhere to the exist- material and so add weight without in- asing the strength. In loose, dusty rubble e adhesive power of the cement is found to reduced to a minimum, the flow of grout broken up into small globules, which occupy e cavities in the old work without ade- ately filling or bridging them. On the ex- riment being made the dusty rubble core the piers at Jedburgh Abbey was found be unsuitable for treatment by cement out which oozed through its interstices thout adhering to the stone. The condi- n of the piers, which were already bulged d bursting under the load of the tower, de it utterly impossible to apply grout at rthing like the necessary pressure, and a w plan of operations had to be prepared. The hazardous and, at that time, novel thod of extracting the core and replacing with masses of concrete was put forward a possible solution of the problem, and was entually put in hand, the Principal Archi- t. H.M. Office of Works, taking direct ntrol of the work. In recognition of the nger of the experiment, precautions were ken to ascertain the conditions under which would be carried out, and a minute inspec- n was made of all sources of weakness roughout the building. Tests were made the nature of the subsoil and foundations, d of the strength of specimens of the ing stones. A set of survey drawings was epared with the overhang of the tower and ll tops beyond the line of their bases care- ly figured. This survey permitted of cal- culation being made of the effect of the unbalanced pressures in different parts of the ruin, and a fair idea of the nature and magnitude of the problem was obtained in this way. Several causes were found to be acting in combination to produce the very unsatisfactory and unstable condition of the ruin. The subsoil, which might have sustained some three tons to the foot, was seriously overburdened by the weights actually put upon it, particularly by the north-east and north-west piers of the central tower. The footings of the piers and walls were of insufficient depth and lateral extent to spread the pressures on the loose sandy subsoil, and consisted of rough boulders carelessly flung together. The pressure from the tower piers was estimated at from eight to twelve tons to the square foot, and its excess over what the ground could bear was demonstrated by the depth to which its northern piers had sunk. These important parts of the structure had descended bodily ten inches at least since they are now out of level by this amount

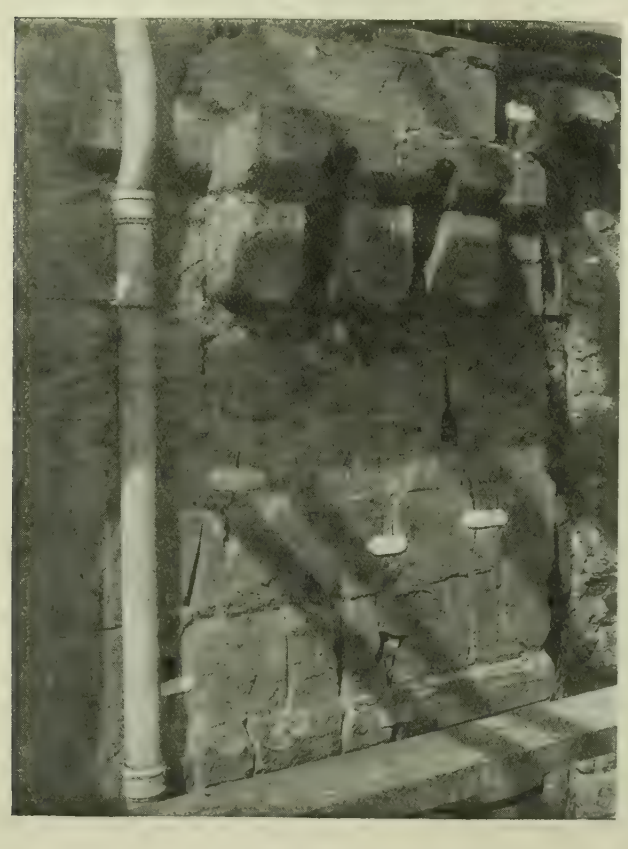
when compared point by point with the less heavily loaded west gable wall.

Beside the very severe distortion occasioned by this subsidence which tended to create fractures between the tower and the surrounding work on all sides, the building suffers from the manner of its construction and from the historical events in which it has taken part. The two most decrepit piers of the tower remain from a Norman building of 1147 and are composed of a thin shell of squared masonry surrounding a rubble core. The southerly pair of piers were erected much later and put into their final shape during the progress of extensive repairs in the fifteenth century, when the Norman arches of the tower were retained and underpinned by the new work. The unequal strength of the piers and their unequal subsidence had thrown the whole tower out of the vertical, and had shaken its masonry into a seriously dilapidated state. Conflagrations in 1523, 1544, and 1545 weakened the fabric, but the chief cause of decay and disintegration was undoubtedly the interaction between movements in the structural masses and in the two imperfectly bonded Norman piers of the tower. These were found to be deflected by the pressures of the tower arches, and were affecting the whole building, even the distant gable at the west end being pushed out to the west some 7 in. in a height of 50 ft.



The mechanical causes of deflections of this kind, which are common to practically all aisled churches erected about a central tower, formed the subject of one of Sir Christopher Wren's tracts on construction, and such movements must be expected from the nature of the original design. They aggravate other defects in the building, however, and have contributed to the dislocation of stonework both in the tower above and in the piers below. The most alarming symptom of decay showed itself in the state of the piers themselves. The facing stones, originally small in their dimensions, had been fractured by the excessive pressure of the tower, the subsidence of the piers bodily into the soil, and the spread of the arches. Vertical cracks had opened in the slight outer skin of ashlar masonry of the piers from base to capital, and continued throughout the soffits of the great arches, revealing the miserably inadequate nature of the powdery rubble core within.

The proposed repairs could not all be undertaken simultaneously; they included the consolidation of the upper part of the tower, the recoring of the two northern piers, and the underpinning of these piers with reinforced concrete foundations. Great care had to be exercised in arranging the order of the work. All parts involved were so perilously shattered that underpinning, though obviously necessary, could not be undertaken in the first place, and it was ultimately decided to undertake a partial repair of the upper part of the tower in order to consolidate it sufficiently to allow of the insertion of temporary needles to support its weight during the further operations. The summit of the tower overhung the base towards the north to the extent of 2 ft. 4 in. in a height of 84 ft., and the northern face was itself bowed out on plan. In addition to these defects, the Norman arches had become depressed and were separated from the masonry of the upper parts of the tower by long raking fissures, the upper portion being kept precariously in position by the accidental corbelling action of the masonry. Notwithstanding the fact that the arches had escaped from under a great part of their load the movement from the semicircle down to a crudely elliptical form had shattered several of the voussoirs until, by the successive nipping off of their tail ends, some had been reduced to a thickness of only 2 in. and 3 in., and remained as a sort of veneer upon the loose rubble core as was afterwards discovered during the actual works of repair.

Preliminary to further operations the arches were supported upon centres, and the outward-leaning upper part of the tower steadied against further overturning mo ments by strong timber raking shores erec upon the summits of the north transept wa These had been prepared by cement grout tamping, and pointing to receive the wei and thrust. Steel rails let into the mase were employed at both ends of these rai to apply their pressure to the best advant

The main gantry, which was to support whole weight of the north wall of the to and half the weight of its eastern and west walls, was next constructed. The great of the masses to be supported and the c plex and difficult nature of the prop operations made the design of this gantr work of great interest, and consider originality and ingenuity was expended u it. To avoid the danger of breaking tower into portions which might sub separately, the adjacent sides were suppor not only on needles penetrating the walls pendicularly to their faces, but also by stronger needles threaded through masonry diagonally across the angles of tower. Three 15 in. by 6 in. by 59 lb. ro steel joists were used for each needle pas through the walls perpendicularly to t faces. The diagonal needles were compo of three 24 in. by 7½ in. by 100 lb. ro steel joists in each case.

The pairs of smaller needles were arran at slightly different levels so that the in ends of each pair could be accommodated above the other on top of the same d shore. The longer and heavier diago needles were supported on top of the o ends of the smaller needles with specially designed packing piece to m up the difference of level between higher and lower needle of each sma pair. The dead shores were six in numb arranged in two groups of three to supp each of the two sets of needles. E dead shore was built up of four 13 in. 13 in. pitch pine baulks bolted together rising to a height of 42 ft. above ground le The main dead shores were connected w

ontal ledgers and diagonal braces to n them against deflection, and were pro- l with 9 in. by 9 in. raking shores to d the area of their base and provide st racking of the whole structure. Be- n the dead shores the common practice of wooden sole pieces was followed and ately involved a certain amount of extra and anxiety since, to avoid movements to shrinkage across the grain, the tim- had to be kept wet during hot weather. ter shoring operations, both at Tintern Rievaulx Abbeys, this cause of anxiety avoided by cutting the shores to the full h and bedding their lower ends hard st a concrete foundation, and their tops a concrete pad pressing directly against masonry to be supported or against a sand box introduced between the tops of dead shores and the underside of the les. At Jedburgh Abbey, in the absence sandbox for gently lowering the needles they had served their turn, a special ce had to be invented at a later stage of proceedings by which this operation could performed. Foundations for the dead es were provided by the insertion of large ses of concrete below ground level.

he remainder of this article will be given week.

The drawings and photographs illustrating article are reproduced by permission of . Office of Works.]

HEAT TRANSMISSION THROUGH WALLS.*

rs is a useful report of thirty-two pages, with trations and tabular data. In an introduc- chapter, upon the ways in which heat is Mr. Weller gives a practical instance of the ortance of the subject by contrasting the es from walls of Fletton and of sand-lime ks, and shows that a six-roomed house built the latter kind of bricks would take an itional ton of fuel per season to keep it as m as a Fletton built house, other conditions g similar. It would seem that heat in- ting powers decrease with increasing density naterials, and also very markedly with in- sed moisture content. The author's method xperiment was based on tests of thermal luctivity of walls of various materials of ut 9 sq. ft. heat being supplied by a large plate, protected by a guard ring, heated rically, and thus readily controlled.

s showing the decreased insulating powers to moisture a test is cited in which a 9 in. k brick in cement wall which thoroughly showed a conductivity of 15·8, decreased in luctivity in fourteen days to 6. Out of en kinds of walling tested, among which a number of cavity wall structures of slabs atent materials, the timber framed structure herboarding studs and lath and plaster— y won first place as a non-conductor, while tons in lime mortar 8½ in. thick proved h superior to various cavity slab or hollow k walls 6 to 7 in. thick. An exception must nade in the case of diatomacious bricks. e tested with concretes and plasters of rent compositions show a remarkably low conductivity. Those interested in building find the short illustrated appendices upon of actual isolated rooms 6 to 7 ft. cube very uctive. Twenty-four such huts were erected the data obtained is concisely given. It ten difficult for an architect to decide upon most suitable form of construction among nany varieties of walling now available, and rches of this character should be studied, will be found a great aid in promoting sound ions.

SOUTH WALES INSTITUTE OF ARCHITECTS.

On November 30 Mr. Percy Thomas, F.R.I.B.A., President, presented the prizes to the students of this Institute, and referred to the improvement in the standard of work shown and the keenness with which the students had competed.

Mr. W. S. Purchon, A.R.I.B.A., head of the department of architecture and civic design at the technical college, Cardiff, gave an address on the work of the school of architecture. He spoke of the close association between the school and the South Wales Institute of Architects, and expressed the thanks of the staff and students to those whose generosity had made the prize distribution possible. He explained that the School, while comparatively young, was steadily growing and that much of its success was due to the ability and zeal of his assistants, Mr. R. H. Winder, A.R.I.B.A., and Mr. Eric Page, A.R.I.B.A.

After dealing with the exhibition of designs and measured drawings, he spoke of work which could not be shown but which was no less important, and instanced the value of study of the history of architecture and the theory of design and construction.

Principal Coles spoke of the part played by students of the department of architecture in the various social and athletic activities of the college and of the undoubted importance of this aspect of college life.

Councillor A. J. Howell, J.P., chairman of the technical college committee, presided over an enthusiastic meeting.

A hearty vote of thanks was passed to the chairman and speakers, and to the members of the Students' Club.

THE R.I.B.A. AND SKILLED LABOUR.

In *The Times* of December 7, Mr. Arthur Keen, F.R.I.B.A., Hon. Sec. R.I.B.A., writes as follows:—"In the building construction industry 112,000 men are stated to be out of employment, but as far as one can hear from architects in all parts of the country there is actually a general and very serious shortage of skilled building men. Bricklayers, carpenters, and masons are scarce; plasterers are a constant difficulty, and I have just heard of a large contract in the London area for which plasterers are actually being picked up here and there in Scotland and brought to London. The unemployment must, therefore, be mainly among the labourers, although some of it is explained by lack of skill in the mechanics. Builders are constantly complaining that out of a dozen men taken on only three or four really know their trade and can be retained after the first few days.

"It is a very serious matter that among the young fellows who came out of the Army there are great numbers who are not equipped for earning their living. Those who have had a superficial training in some trade have not sufficient skill to ensure regular employment, and many of those who seek work as labourers have not the physical strength that it requires, to say nothing of the very considerable amount of rough skill in digging or concrete mixing and scores of other things which the regular builders' labourer possesses. This shortage of skilled mechanics is no question of tariffs or free trade, and it affects the public closely, because it means that building involves far more time and cost than should be necessary; it means, further, that the unskilled men must stand idle.

"The Council of this Institute is so convinced of the fact of the dearth of skilled labour in the building trade that it has set up a committee to study the matter. In many instances might not the Board of Education do more to supply the place of the old-fashioned apprenticeship which has become so rare?"

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

At a meeting of the Royal Archæological Institute, held in the apartments of the Society of Antiquaries, Burlington House, Piccadilly, W., on Wednesday last week, Mr. W. H. Godfrey, F.S.A., gave a lecture on "Old Chelsea," in which he recalled some of the residents of the past who had lent it real significance. It was Sir Thomas More, he said, who "discovered" Chelsea and drew fame to her during the fourteen years spent there before his tragic end in 1535. Sir Thomas's property lay in the western portion of the parish, and his house looked immediately southwards on to that part of the river now crossed by Battersea Bridge. The house was approached by a drive from the waterside on the site of which Beaufort-street now ran. Westward was Lindsey House, the solitary survivor to-day of Chelsea's ancient palaces; it represented the original farmhouse purchased by Sir Thomas More and rebuilt by the Earls of Lindsey. Behind it still stood Gorges House, a many-gabled Jacobean building erected by the Earl of Lincoln. Further back was More's stable yard, to-day the Moravian burial ground, with part of the Tudor walls and buttresses of the stable buildings incorporated in the structure of the Moravian Chapel, which had recently been converted into a studio. Eastward was the large enclosed garden, formerly Dovecote Close, now occupied by Paulton's-square, south of which was a favourite bit of More's estate, whereon he built a summer library connected with his house by the long raised terrace, which remained until Kip's time. That portion of the estate later became the site of the little house and garden built by Sir John Danvers, which won the praises of Aubrey and Pepys. The house of Sir Thomas More had been altered since his time for a string of noblemen of diverse character and ambition, from Henry VIII's Paulet, Marquis of Winchester, to James I's Villiers, Duke of Buckingham, who lived there and worked their will. The principal alterations were made by Sir Robert Cecil, the builder of Hatfield.

East of More's estate stood Arch House, in Queen Elizabeth's time the mansion of Thomas Hungerford. His tomb was in the old church, which still remained much as it was in the early days; the fabric and monuments together represented very completely the history and past life of the village. The chancel, containing on the south wall the tomb of Sir Thomas Lawrence, was the earliest part of the building, and dated back to the thirteenth or early fourteenth century, the original timber roof being still preserved. Lady Dacre's monument (1595) in the south aisle was the finest in the church, and a splendid example of Elizabethan design. In the north aisle was the tomb of Lady Jane Cheyne, who purchased Henry VIII's manor, and to whom Cheyne Walk, which passed the house, owed its name.

Amongst the many notable inhabitants of Church-row, built by Sir Thomas Lawrence in 1689, were Holman Hunt, who here painted "The Light of the World," and James Salter, the barber, collector and coffee-house proprietor. Writing in 1705, Bowack said of the village: "The place is noted for good conversation, and for many honourable worthy inhabitants . . . living in perfect amity amongst themselves, and having a general meeting every day at a coffee house near the church, well known for the pretty collection of varieties in nature and art, some of which are very curious."

A vote of thanks was passed to Mr. Godfrey for his lecture, which was illustrated by many interesting slides, some of which illustrations appeared in *The Builder*, June 29, 1917.

THE BUILDING TRADE.

THE COST OF BUILDING.

BY T. P. BENNETT, F.R.I.B.A., Hon. F.I.O.B.

IN continuation of the analysis of *The Builder* Cost of Building Competition, the graph reproduced herewith shows the cost of the items billed under each trade heading for the whole of the tenders for the "A" houses. Each of the tenders has been marked on vertical lines and every fifth line drawn, while each horizontal line in height represents £100.

The actual totals and percentages for each trade for the winning and highest tenders are as shown in the table given below :—

PERCENTAGES (TRADES TO TOTALS).

	No. 47 Lowest accepted Amount.	Per cent.	No. 92 Highest Amount.	Per cent.
	£ s. d.		£ s. d.	
Tenders	1,197 16 8		2,158 15 5	
Preliminaries	2 10 0	·209	11 0 0	·50
Excavator, Concrete and Drains	94 8 5	7·88	229 12 9	10·63
Bricklayer	353 1 8	29·97	570 5 7	26·41
Tiler	67 13 4	5·64	113 14 5	5·17
Carpenter, Joiner and Ironmonger	337 4 10	28·15	666 3 4	30·85
Plasterer	108 4 10	9·03	162 2 5	7·51
Plumber, Glazier and Painter	183 3 9	15·29	353 16 11	6·39
Insurance	16 3 4	1·34	17 0 0	·78
Contingencies	10 0 0	·83	10 0 0	·46
Gates and Paths	25 0 0	2·08	25 0 0	1·15
	£1,197 16 8	100·50	£2,158 15 5	99·85

The price per foot cube of the winning tender is 11.74d., made up as follows :—

Preliminaries .02d. ; Excavator, drains, &c., .92d. ; Bricklayer, 3.51d. ; Tiler, 0.66d. ; Carpenter, Joiner and Ironmonger, 3.30d. ; Plasterer, 1.06d. ; Plumber, Glazier and Painter, 1.79d. ; Insurance, 0.15d. ; Contingencies, 0.09d. ; Gates and Paths, 0.24d.

From the graph and from these tables it will be seen that the bricklayer and carpenter and joiner absorb proportionately the largest amounts of the total cost, and that the plumber, painter and glazier are next with the plasterer following. A further reference to the graph shows that, broadly speaking, this ratio is followed in the rising tenders but that some trades vary considerably more than others. It is noteworthy that even with only so small an amount of the work priced as the preliminaries and the excavator there is a difference between the lowest and the highest tendering for these two trades of about £130—a very substantial amount. In the bricklayer the variation is very much more marked. The total of work up to and including this trade in tender No. 44, from Cambridge, is £300. In tender No. 97, from Llanelly, it is £1,090, or very nearly as much as the complete lowest tender. Some of the tenders, of which the total is comparatively high, show relatively low figures for the work up to and including this trade, notably No. 38, from Belper; No. 158, from London; No. 48, from London; No. 5, from Southport. A notable feature is the way in which some of the prices are levelled up, as, for example, No. 48, which, with preliminaries and excavator, is abnormally high, while the addition of the bricklayer brings the figure well below the average for the position which its total cost occupies.

The principal comment on the "Tiler" is the fact that its variations in cost follow in a remarkably regular manner the variation of the bricklayer, thus suggesting that the cost of tiling all over the country is well known and subject to few variations either as regards the supply or labour of laying.

The "Carpenter and Joiner," although showing a fair amount of variation in itself, yet has a great steadying effect upon the amount of the tender. It is obviously the trade upon which the builder relies to help him out with his cost. It may, of course, be influenced by the possession or otherwise of well-equipped machine or other shops, or the possibility of the purchase of ready-made joinery, but whatever the cause, its influence is great.

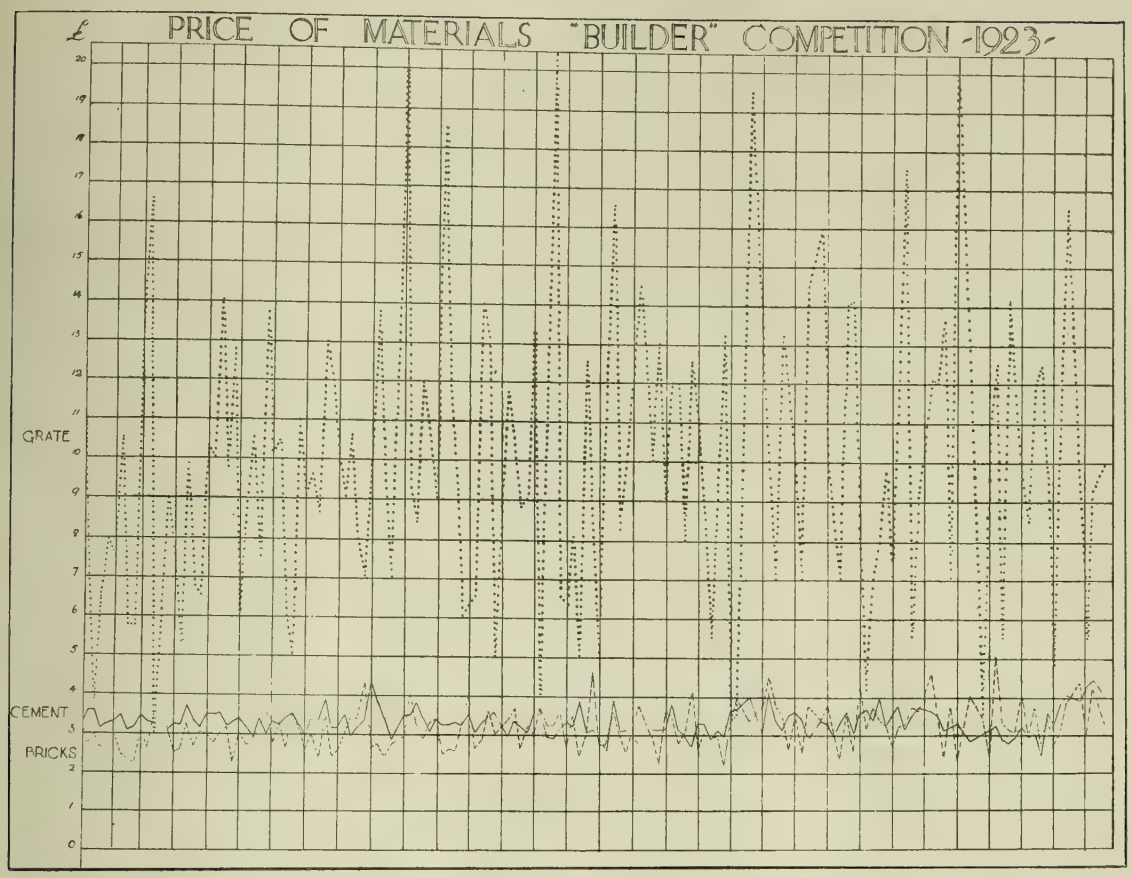
This influence is most marked in the case of No. 144, from Waltham Abbey; No. 38, from Belper; No. 71, from New Barnet; No. 48, from London; No. 65, from Birkenhead; No. 158, from London; No. 169, from Newcastle. The peak, which appears in No. 141, from Bedford, is due to the contractor deducting 10 per cent. after his total had been arrived at. This reduction has not been shown on the graph.

The plasterer like the tiler, shows a very steady addition to cost. There is obviously very little to be saved or gained in this trade. Its graph suggests that the price of materials is constant, the amount used is well known, and that the output of the plasterer is subject to but small variation.

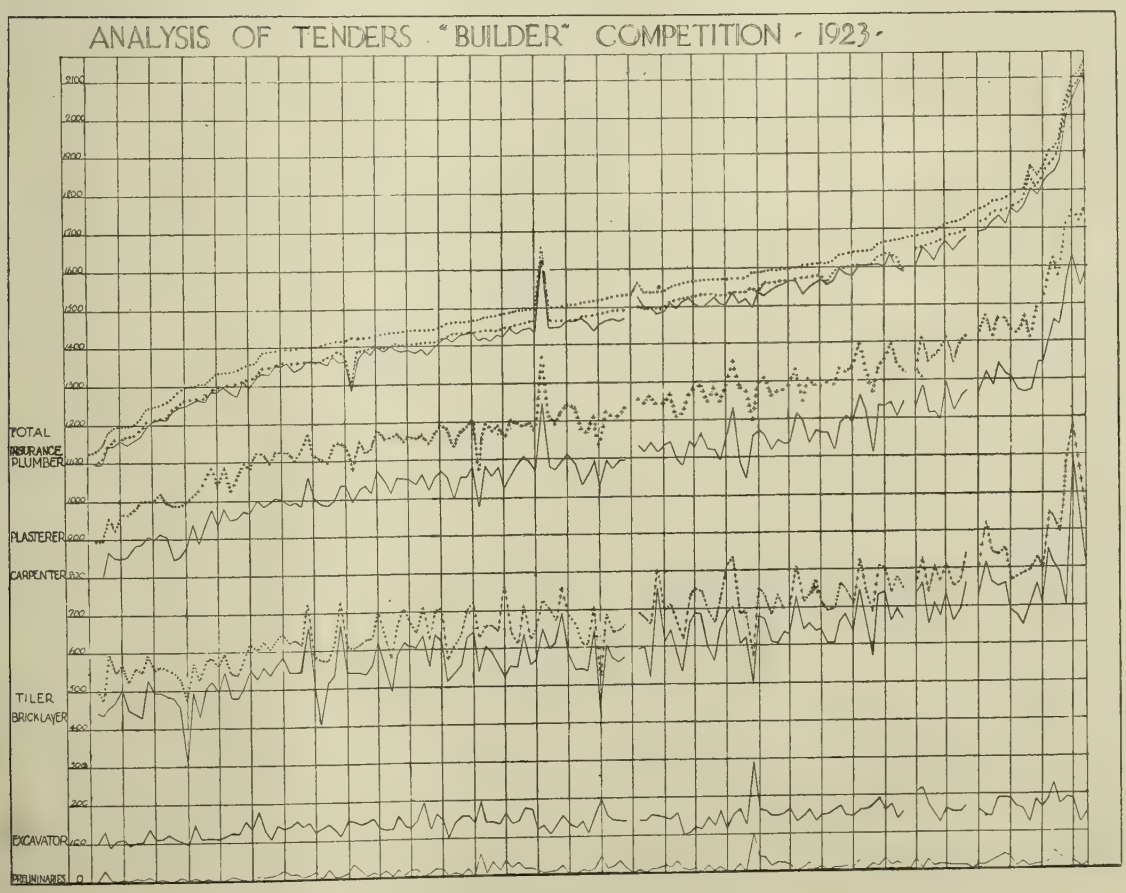
The plumber, painter and glazier, unlike the plasterer, is a trade or group of trades, which again shows considerable variation in cost. It may be that in this trade, as in the carpenter and joiner, there is considerable variation in the standard of the work, and, consequently, of the cost of that work, and that, therefore, it would be reasonable to expect quite a different amount of finish from the firms who have given high prices from that given by the firms with low prices. Upon the other hand it may be merely that the work is more speculative and that this accounts for the variation; or, again, it may be that timber, lead and paint are subject to greater fluctuations than other materials in the market, and that the price of the executed work varies in accordance with advantageous or unsatisfactory buying. Certain tenders again cause comment, such as No. 114, Bridport; No. 72, Hampton-on-Thames; No. 5, Southport; and No. 69, Birmingham. The recurrence of the numbers of one or two competitors in these comments suggests erratic and, therefore, not very competent tendering. Finally, the sudden rise of the total cost of the last nine tenders is curious, as is also the sudden drop of the first five, but both are, of course, in accordance with everyday experience. The steadiness of the increase of the remaining tenders is, however, extremely interesting. The soundness of the prices for each trade in many of the tenders is a matter upon which the authors may justly receive hearty congratulations.

The next matter which calls for examination is the way in which the individual items make up the total tender, for which purpose the winni tender for "A" houses has been used.

If a list is made of absolutely essential ite ignoring their contingent labours, it is fou that quite an extraordinary proportion of money is absorbed. In the following l therefore, the item for "drains" is for pipe-runs alone, without any bends, connectio manholes, gulleys, or traps. "Brick wall include only the actual walling with no all ance for rough cutting, holes, chimney-pots, bricks, or any other accessories. Other it have been similarly treated :—



Concrete in foundations	£25 13
3 in. do., under floors	7 5
4 in. do., under pavings	6 18
4 in. do., under lino.	4 0
Drains—shallow excavation	4 8
Excavation average 3 ft.	4 1
Walls	203 0
	37 10
	1 11
Air bricks	2 17
Red quarries	7 18
Damp course	6 4
Fireplaces and stoves	47 4
Copper	4 8
Roof tiles	51 16 1
Constructional timber	47 0
Wood floors	25 4
Staircase	18 17
Windows, doors and panels	99 17
Plaster ceiling	31 18
,, walls	46 6
,, reveals and soffits	10 4
Rendering lintols	2 5
2 in. breeze partitions	2 2
3 in. breeze partitions	5 10
Gutter	4 3
Down pipe	4 5
Soil pipe	3 6
Lead service	8 3
Sinks	4 4
W.C., &c.	7 8
Lavatory basins	5 12
Baths, &c.	16 0
Glass	9 13
Painting	19 17
Solignum	6 12 11
Whiten ceilings and distemper	15 15
Gas or electric light	20 15
	£829 16 3



This constitutes the bare structure with ju its bulk items included, and already it amoun to over two-thirds of the total amount. Iten which might be executed by a less efficient b cheaper method are :—

Concrete lintols	£13 6 3
Roof boarding	22 0 0
Ironmongery	25 14 11
Lead flashings	12 10 0
	£73 11 2

While items which might be called "luxurie include :—

Plinth offset	£0 17 8
Cavity wall	7 0 8
Facings	5 7 6
Tile creasing	1 12 0
,, necking	1 11 0
Oak beams	7 0 0
Roofing felt	9 15 0
Skirting and picture rail	13 5 0
Lino	6 11 8
Hood to door	5 16 6
Window boards	11 10 0
Shelves, cupboards and drawers	8 3 6
Pipe grounds	2 17 0
Draining board	0 17 6
Dresser	11 16 10
Rounded angle in plaster	3 9 0
Dustbin	1 6 0
	£98 16 10

The Cost of Building. (*See p.* 932.)

The relative percentages of these amounts are :

Bare carcasing	69.86
Alternative constructional features	6.19
" Luxuries " or decoration ..	8.31

The remaining 15.64 per cent. is entirely absorbed by the accessory services, which, as before mentioned, have not been included in the items listed. This analysis is well worth careful study because it shows quite conclusively that almost the entire cost of house construction is rigid. That if solid houses are required their cost can be reduced only by a very small margin, and that even the margin of 8.31 per cent. indicated here would not actually occur in practise because the accommodation provided by shelves and cupboards, a dresser and a dustbin must appear in some form or other, and if not provided in the contract for the house must be bought as furniture. Lino is in a similar category, while the amount spent upon architectural treatment is so small that it barely suffices for the most meagre relief from monotony in house building. Reference will again be made to this matter in the concluding article which will contain a summary of the information gained by the running of what has proved a very valuable competition.

It may be of interest to quote from the assessor's report, which states that the following was the range of the tenders :

London tenders								
	from	£1,249	18	11—	£1,898	19	6
" A " towns	„	1,160	11	5—	2,030	7	8
" A 3 "	„	„	1,298	19	7—	1,600	0	0
B1 & 2	„	„	1,357	7	1—	1,776	19	9
C	„	„	1,144	12	7—	2,114	10	7

From this list appears the somewhat remarkable fact that the tenders are in many cases lowest from towns paying the highest rates of wages, an indication probably of the fact that the best and quickest craftsmen tend to migrate to the better paid centres. But no doubt there are other reasons due to commercial conditions of town life which enable the contractor to economise in other directions. It may be of interest also to compare the actual prices of certain items in the best tenders which are given by the assessor as follows :

A comparison of the priced Schedules of the best tenders received shows :—

	s.	d.		s.	d.
Excavating in trenches, wheel and deposit	1	4	to	2	3
Concrete	24	9	to	37	6
4 in. Drain shallow excavation	1	0	to	1	0
9 in. Brickwork in mortar ..	9	3	to	11	4½
Extra for facing with picked bricks	–	5	to	1	3
Granolithic paving 1 in. thick	3	0	to	5	10
Roofing with Roman tiles ..	50	0	to	64	0
Roofing with Staffordshire tiles	60	0	to	95	0
Fir in floor joists	3	0	to	4	3
1 in. Wrot deal floor ..	30	0	to	38	0
1¼ in. rebated and moulded casements	–	9	to	1	3
1½ in. square-framed four-panel doors	1	0	to	1	5
Lath and plaster, two coats on ceilings	2	5	to	3	0
2 in. concrete partitions ..	2	6	to	3	10
Sheet lead in flushing ..	40	0	to	50	0
4 in eaves gutter	–	6	to	1	0
4 in. L.C.C. soil pipe ..	1	5	to	2	0
40 gall. 12 gauge galvanised wrot iron rain-water tank drilled for connections ..	30	0	ro	60	0
Glazed fireclay 27 × 18 × 10in.	30	0	to	52	6
W.C. suites	60	0	to	114	0
5 ft. 6 in. long overall white porcelain baths 3 in. roll..	140	0	to	160	0
15 oz. sheet glass	–	4	to	–	7½
Knot prime stop and three-paint on all joiner's work..	1	0	to	2	0
Prepare and once stain on woodwork	–	3	to	–	6

THE TRADES TRAINING SCHOOLS.

THE annual prize distribution of the Trades' Training Schools, conducted by the following City Guilds—The Armourers and Brasiers, Carpenters, Glaziers, Joiners, Paint-Stainers, Pewterers, Plaisterers, Tylers and Bricklayers and Wheelwrights, Great Tichfield-street—was held at Carpenters' Hall, London Wall, on Thursday, last week, presided over by the Master of the Carpenters' Company, Mr. W. H. Evans.

Mr. Frederick Sutton, J.P., Past Master of the Carpenters' Company and Chairman of the Schools' Committee, read the annual report, which stated that there were 363 students in attendance, an increase of 39 on the previous year. Since last session the plumbers' class had been taken over by the Pewterers' Company, and the members had increased to such an extent that they overflowed the workrooms into the corridor. Good work was being done there, and in April last the members of that class executed a lead casket, designed in the office of Sir Banister Fletcher, for the Zeebrugge memorial, in which were placed the records of the Navy on that memorable day of St. George, 1918.

Sir Banister Fletcher, F.R.I.B.A., Director of the Schools, gave the thirtieth annual report of the work carried on during the Session, 1922-3. In the course of his report, he said that the attendance had reached a total of 12,892, with an average of 86.52 per evening, which, considering the causes that had operated against sustained attendance, was extremely satisfactory.

The judging of the exhibits of students' work took place on May 10, the judges being :—Mr. Frederick Sutton, J.P. (Past Master of the Carpenters' Company and Chairman of the Schools), Mr. G. C. Barnes (of the Joiners' Company), Mr. E. Guy Dawber, F.R.I.B.A., Mr. F. G. Dear (of the Painters' Company), Mr. Charles Denny (Master of the Carpenters' Company), Mr. W. J. Englefield (of the Pewterers' Company), Sir George Frampton, R.A., Commander T. Free (Master of the Joiners' Company), Mr. F. T. W. Goldsmith, F.R.I.B.A. (Past Master of the Plaisterers' Company), Mr. W. Stewart Greene (of the Painters' Company), Mr. W. Grellier, F.R.I.B.A. (Past Master of the Tylers' and Bricklayers' Company), Mr. C. F. Hewlett (of the Glaziers' Company), Mr. Alexander L. Howard, J.P., Sir W. Goscombe John, R.A., Mr. L. J. Johns (of the Plaisterers' Company), Mr. Arthur Keen, F.R.I.B.A. (Hon. Sec. R.I.B.A.), Mr. Ellis Marsland (of the Tylers' and Bricklayers' Company), Mr. W. G. Minn (Past Master of the Painters' Company), Mr. G. S. Pinchin (of the Pewterers' Company), Mr. Percy Preston (Past Master of the Carpenters' Company), Mr. Frank W. Robson (Master of the Wheelwrights' Company), Mr. S. G. Castle-Russell, M.I.E.E., Mr. H. D. Searles-Wood, V.P.R.I.B.A., Mr. N. P. Shepherd (of the Wheelwrights' Company), Mr. A. R. Upjohn (of the Glaziers' Company), and Mr. G. Hutton Freeman (Clerk to the Carpenters' Company).

The following trades and crafts met, during the Session, under the tuition of the undernoted :—The Carpenters, Mr. Henry S. Playshead, assisted by Mr. Archbold ; the joiners, Mr. Charles E. Dunking, assisted by Mr. Howe ; the Masons, Mr. H. G. Bush ; the Glaziers, Mr. J. Dudley Forsyth; the Painters, Mr. H. J. Fowler ; the Plaisterers, Mr. W. H. Pearson ; the Plumbers, Mr. Tom Gooding, assisted by Mr. Pardoe ; the Metal Workers, Messrs. R. N. Caldwell and H. Collins; the Stone-Carvers, Mr. Alfred J. Oakley ; the Life Class, Mr. Charles L. Hantwell; the Tylers and Bricklayers, Mr. F. A. Billinghurst ; the Wheelwrights, Mr. W. E. Cox ; the Wood Carvers, Mr. F. A. Markham ; the Electricians, Mr. S. Nicholes.

A course of 36 demonstrations was given to the architectural students of University College by the instructors in brickwork, masonry, carpentry, joinery, external and sanitary plumbing, slating and tiling, plastering, smithing an painting.

Sir Banister Fletcher said that on those engaged in the various crafts were taug in the workshops. They were passing throu an era of difficulty in the building industr and were suffering from a lack of skilled craft men, largely because during the war t training of craftsmen in the building indust practically ceased. In reference to the questic of the number of apprentices allowed in pr portion to the skilled craftsmen in the vario shops, the R.I.B.A. was joining in a conferen with the Building Employers' and the Oper tives' Federations to see if the difficulty cou be surmounted. They would also have t consider why large numbers of skilled me were leaving this country for America and t British Dominions, and whether this exod was due to the Trade Union regulations of th country as to output and working hours. I regard to apprenticeship the present state national finances and taxation made it impossib for the State to do anything. If two rece benefactors had only left their bequests, whic amounted to £32,000, to the company for hel ing apprentices to exist during their five years hard training, how much better would it hav been for the welfare of the community. I was skilled craftsmen they wanted, and unles stringent steps were taken England would b in a deplorable condition in this respect. Finall any young man would find his prospect increase if he supplemented his day work by evenin attendance at the Trades Training School maintained by the Worshipful Company c Carpenters and the Associated City Companie where the highest traditions of the crafts ha always been maintained.

The prizes were then distributed by Si Edward Marshall-Hall, K.C., who, in addressin the students, said he always took the greates possible interest in what he called work, and favourite motto of his was " Whatever thy han findeth to do that do with all thy might." I they stuck to that through life and carried i out conscientiously they would find it was th secret of success. He begged them to cultivat the gift of concentration, and never to b ashamed of laughing, but when they had worl to do it with all their mind. He felt that ther was a deplorable lack of concentration at th present time, and they should get into such condition of mind when working that the would be conscious of nothing going on aroun them except their job. Before handling thei tools they should take their measurements make up their minds what they were going to do and know how to make use of their material in order to get the maximum of quality wit the minimum of quantity, which would mea so much more added to their wages. Quality was the first ambition of a good workman, and quantity was subsidiary to quality. Great Britain had built up a reputation in the manufactures of the world, and she owed her commercial superiority to her reputation for quality and honesty. He did not think there ever was a more disastrous Act passed than the Merchandise Marks Act, because people in other countries got to know where they could buy things which they thought just as good, but which were in reality not so, and dishonest traders abroad stamped their goods " Made in England." The quality of things made abroad had improved, and we must, therefore, maintain our quality and have it said that because our goods were English their quality was impeachable. Technical education, he said, was the backbone of the country's success, and it was the work of bodies like the City Companies which was building up a great assurance for the future by teaching the students how to learn, how to work in the best way, and by that means to stimulate the alliance between employer and employed.

Cordial votes of thanks were passed to Sir Edward Marshall-Hall, the Companies, the Chairman, and others.

IRON CORROSION.

Sir Robert Hadfield, Bart., D.Sc., F.R.S., ., at the recent opening of the new research boratory and lecture room of the Municipal chnical School, Birmingham, made some teresting remarks concerning the corrosion of on. He estimates that there is a loss to the rld by corrosion of at least £500,000,000 nually; hence the importance of a serious vestigation into this complex problem. uoting from a paper by Dr. Friend, he pointed t "that iron does not rust in dry air; in pure uid water in the absence of air; in moist air constant temperature; in steam at tempera- res not much above 100 deg. C." He also entioned two important theories, namely, the id theory, in which ordinary water is supposed contain a little CO_2, forming an acid which tacks the iron; and the electrolytic theory, in hich a little iron goes into solution in the Ionic" form, liberating hydrogen which is tacked by oxygen from the air to form water. ore iron then ionises, and so on until ferrous ide separates, and is more or less oxidised to rric oxide, that is rust.

But Heyn and Bauer found that when the ater is moving, the rate of corrosion at first creases and afterwards declines with the rate flow. Dr. Friend's experiments show that ith a high rate of flow no corrosion takes place nd no rust is formed, any small losses in weight eing due solely to erosion. It has further been own that with moving acid solutions, the ster the motion the greater the corrosion. ence corrosion in water is fundamentally ifferent from corrosion in acid.

The discovery of an iron or steel alloy that ould resist corrosion and would at the same me be available for building in sufficient quanti- es, and at a reasonable price, would revolu- ionise building, and the importance of such ork as is being undertaken by the research aboratories, such as that at Birmingham, cannot e over-estimated.

NORTHAMPTON POLY-TECHNIC INSTITUTE.

On December 7, Dr. R. Mullineux Walmsley, Principal, delivered the twenty-sixth annual report of the Institute. The hair was taken by Mr. L. B. Sebastian, hairman of the Governing Body, and Sir W. Martin Conway presented the prizes.

In the course of the report, Dr. Walmsley aid that owing to causes reported a year ago, nd which were still in operation, the enrol- nents showed a falling off on those of the receding session, the number of individual nembers and students being 2,888 against 3,209 in 1921-2.

Dealing first with the Engineering Day College, the most important section of the day work, the number of enrolments, which was 286 in October, 1921, fell to 257 in October, 1922. The decrease, though not very substan- tial, was mainly due to the loss of ex-service men, whose courses had either been com- pleted or otherwise terminated.

During the session under consideration there were 150,722 enrolments, as against 166,147 in the preceding session. The average hour per student for the session was main- tained at 81, which was the same as the figure reached in 1921-2; both figures com- pared favourably with 63, which was the num- ber of average student-hours in the session 1920-1. It was sincerely to be desired that, as soon as the present financial stringency had passed away, additional accommodation, pro- mised long ago, would materialise. When it did materialise schemes were already drafted for extensive developments without altering the general character of the important work now carried on at the Northampton Polytechnic Institute.

In the prize list it would be found that twenty-one students had been awarded the B.Sc. degree in Engineering at the University of London. In this connection it might be said that the main aim of the Engineering Day College and of the engineering work in the evening was to train engineers, but it was claimed that the training as modern engineers was so thorough at the "Northamp- ton" that the University requirements for a degree could be easily satisfied by those who qualified for the four-year certificate of the Institute's day college, and by those who took a thorough five-year course of training in the evening classes.

The various clubs had well maintained their positions in competitions with similar outside clubs, with the exception of the members' Gymnastic Club, which had the misfortune to lose the "Adams" Shield, which it had successfully held for five consecutive years.

After the conclusion of the Principal's report, Sir W. Martin Conway, prior to the distribution of the prizes and certificates, gave a short address to the students, in the course of which he said that, as an explorer, he knew that the determination to succeed and the right equipment were essential for the work that had to be done in life. He would impress upon them that determination must be persistently cultivated, not on great occa- sions only, but day after day, hour after hour. Success would be all the sweeter as the labour of attainment had been great.

At the conclusion of the distribution of prizes a vote of thanks was passed by Sir Thomas Holland.

LAW REPORT.

In the Chancery Division, before Mr. Justice Lawrence, Mr. P. L. Townsend brought an action to recover damages against the defen- dants, Messrs. Garritt & Co., Ltd., of 34, Dean- street, Soho, London, in respect of the alleged obstruction to the access of light to the rear rooms on the ground floor and the first and second floors of his premises, 33A, Dean-street, by the increase in height of the defendants' building. The plaintiff originally claimed a mandatory injunction, but that claim was abandoned during the trial, and the only question left to be decided was whether the light which the plaintiff's tenants now enjoyed was such as to render the rooms lighted by the windows in question uncomfortable and unsuitable for the ordinary purposes of living, or business, having regard to the ordinary notions of mankind and the locality in which the property was situated.

Mr. R. H. Kerr, architect and surveyor, Mr. C. Nicholas, F.R.I.B.A., and Mr. Harrison Martin, surveyor, gave evidence for the plaintiff; and Mr. G. G. Stanham, architect and surveyor, Sir Banister Fletcher, F.R.I.B.A., and Mr. W. S. Mercer, architect and surveyor, gave evidence on behalf of the defendants.

Mr. Justice Lawrence visited the property before giving judgment, when his lordship held that with regard to the ground floor the back room was merely a dark cupboard, with respect to which it would be impossible to maintain a claim for diminution of light. As to the first and second floors, the windows, he said, were exceptionally large for such small rooms which, in his opinion, had all the light which could be expected in London in these days for rooms in that locality. It was amply sufficient for occupancy and business in that district. Part of the light was due to the white glazed bricks used by the defendants, but it was impossible for him to say what deterioration, if any, might happen in the future. Even if he was wrong in holding that the rooms were sufficiently well lighted, he was convinced on the evidence that there was no damage at all to the site value. The building was old, un- suitable and practically worn-out, and was not a building that would be allowed to be erected at the present time. In all the circumstances he dismissed the action with costs.

Judgment was entered accordingly.

POOR LAW UNIONS AND THE RATING BILL.

At a recent meeting of the Association of Poor Law Unions, an Association which repre- sents, it was stated, a population of about 35,000,000, as 589 Boards out of the 640 Boards of Guardians in England and Wales are repre- sented, the proposals contained in the new rating and valuation Bill were considered, and a report prepared by the Council of the Associa- tion was approved by a large majority. The report, as given in *The Times*, stated that the Council were of opinion that there was no necessity for the great constitutional changes proposed in the Bill, and it was contended that the Poor Law Union areas should be retained in any measure amending the Union Assessment Acts, for it was believed that the establishment of a central valuation authority and the general transfer thereto of the valuation of special properties would serve no useful purpose. The special case of railways and canals could best be met by giving statutory power to an associa- tion of assessment committees to set up machinery for their valuation as complete units. The objects of the draft Bill, so far as valuation was concerned, could be secured by strengthening and reinforcing the existing machinery of valuation by empowering the overseers and assessment committees to obtain returns from owners and occupiers; by provid- ing for new valuation lists not less frequently than once in five years; by providing for the co-operation of the Inspector of Taxes, as in the Metropolis; and by the addition of a General Commissioner of Inland Revenue and repre- sentatives of spending authorities to each union assessment committee. The Council added that the Association would give its support to a Bill embodying these reforms, but would strenuously oppose any measure making great constitutional changes which would unnecessarily interfere with the working of the old and well-established system used in connection with local rating. It will be observed that this report accepts, although somewhat tacitly, the principle of one common assessment for rates and taxes, but this is a question of more interest possibly to the ratepayers than to the bodies responsible for making the valuation lists. From the rate- payers' point of view, there seems something in the contention of Sir H. Trustram Eve that the valuation for this double purpose is incom- patible, and he again stated his reasons very clearly in a letter published in *The Times* (November 19).

So far as we have seen, insufficient evidence has been laid before the public at present on this important question, and it is one to which those bodies who represent the ratepayers should especially address themselves. Those in favour of the innovation have a precedent to cite in the adoption of the principle in the Metropolitan area, but conditions in the Metropolis may vary in important respects from conditions in the country generally, and in the extended period now allowed for the impartial consideration of this Bill, we cannot but hope that evidence will be laid before the public from the rate- payers' point of view. Sir H. Trustram Eve contends that the single assessment is but an ideal, and an ideal which can only be attained to the disadvantage of the ratepayer, as it is not possible in practice (especially in these days of extraordinary post-war values), to make a valuation list containing assessments which are fair for rates and yet conform to the practice of the Inspector of Taxes or Revenue Officer for taxes, and in the letter above referred to he indicates his reasons.

Obituary.

The death occurred on December 8 of Mr. John Coldwell, aged 74, architect, of Carlton- terrace, Spennymoor. A native of Bamborough, Northumberland, he was surveyor to the Spennymoor U.D.C. for 16 years prior to retiring in order to commence a practice on his own behalf. He was a member of the local authority for 23 years, and an ex-chairman.

RUBBER ROAD SURFACING BLOCKS.

A NEW rubber road system, invented by Mr. C. W. Read, which has just been placed on the market, consists of a covering of rubber, vulcanised to stand hard wear, moulded in channel or U-shape, and in such lengths as may be required. The rubber is ¾ in. thick on tread and the sides ⅜ in. thick; the width varies according to circumstances, but for general road covering 9 in. has been found the most suitable. For indoor work (halls, vestibules, &c.) and fairly large indoor areas, 6 in. would be a suitable width, while for stair treads, &c., 2 in. to 3 in. is found a good average width. For laying roads a foundation of concrete is used, in which slots are formed 2 in. deep at intervals of 9 in.; these slots receive the side walls of rubber channel and form the anchorage for the rubber surfacing. A thin coating of bitumen is brushed on to the concrete before the rubber is laid, but this is used as an undercoating and is not necessary as a binding medium, the side walls of rubber channel having, we are informed, such a grip on each other that it is impossible for the rubber to move in any direction.

For indoor work a lighter form of block is used, and the slots for fixing can be formed by laying strips of wood the width of block. As it is proposed to make the rubber surfacing in various colours for indoor work, it will be possible to get any combination of colours for tiling effects.

It is claimed that this system works out at less than half the cost of other rubber surfacing, and will cost very little more than other forms of road covering already in use, while the cost of maintenance would be a very small item. The manufacturers are Messrs. F. & E. Stanton, Ltd., of Harders-road, London, S.E.15.

NEW BUILDINGS IN LONDON.

Regent-street.—NEW BUILDING.—Messrs. Walter Lawrence & Son, of 19, Finsbury-square are erecting a new building at 176, Regent-street, for the Gopher Diamond Co. The architects for the work are Messrs. Yates, Cook & Darbyshire, of 43, Great Marlborough-street, W.1.

Euston.—INSURANCE BUILDING.—Additions are being made to the main insurance offices of the National Amalgamated Approved Society by Messrs. Foster & Dicksee, Ltd., at a cost of £16,000. The front elevation is of Portland-stone and is in Melton-street, adjoining the main building on the west side of Euston-square erected in 1915-7 by the same firm. The constructional steelwork is by Mr. H. Young & Co. Ltd., of Nine Elms. The architect is Professor Beresford Pite, of 101, Great Russell-street, W.C.

Rent Restrictions Acts.

Mr. Graham Mould, Barrister-at-Law, gave the first of a series of two lectures on the Rent Restrictions Acts at the College of Estate Management on November 27. He showed that the main purpose of the Act was to give tenants of various classes of small property a security of tenure, and then explained the definition of a dwelling-house under the Act, and showed how it included ordinary houses, sets of rooms, flats, and houses and shops combined. He then dealt with the limits of value as applied to the different parts of the Kingdom, and pointed out that it was not necessary for both rent and rateable value to come within the limit, but that if one came within the limit, the property was considered to be within the scope of the Act. Finally, he dealt with the various exceptions under the Act, and also the question of what constituted tenants, furniture, &c., the rights of subject tenants, and the benefits given to the landlord by the 1923 Act in the matter of possession, and illustrated the various parts of the Acts by cases which had recently come before the courts.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4	1/0
Bedford	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½

(For rates of wages in the Building Trade in Scotland, see page 937.)

THE RENT ACTS.

Apportionment.

An important decision appears to have been given in the recent case, Kimm *v.* Kohen (*The Times*, November 22). In March, 1921, the plaintiff had let to the defendant three rooms in a house, including the use of the bathroom, cellar and garden; the rent was £1 a week, and it appears the landlord paid the rates. In October, 1922, a reduction in the rates of the district had taken place, and the tenant considered that some reduction should be made in the rent in respect of this, and he refused to pay rent until this request had been granted. Some correspondence ensued between the solicitors of the parties, and inquiry was made on behalf of the tenant as to what the standard rent of the premises was. In January, 1923, the landlord issued a summons for £11 unpaid rent, and a counterclaim was put in by the tenant in which it was stated that the standard rent of the premises was £52, and claiming the apportionment for the three rooms. There appear to have been several hearings, but eventually the Judge of the County Court held that was for the landlord to prove the standard rent, and this was proved at £52. An apportionment summons was then taken out, and the registrar apportioned the rent for these rooms at 11s. 7d. a week, a figure that was accepted as correct by the parties. The hearing of the case was resumed on May 20, and at this hearing, on behalf of the tenant, a claim was made for £36 3s. 10d. as rent overpaid by him, being the difference between 11s. 7d. and the rent of £1 paid by him for eighty-six weeks. The landlord's counsel contended that the apportionment could not be retrospective and the Judge appears to have accepted this view, for he held that there could be no over-payment until the apportionment had been made, and gave judgment for the landlord for the £11 claimed and dismissed the counterclaim. On appeal, a Divisional Court held that there was nothing in the Rent Act to prevent the apportionment being retrospective, and the tenant was entitled to recover overpayments, and judgment was given for the tenant for £29 16s. 5d. There is nothing in the report to show why the sum awarded differed from the amount counterclaimed for. This is, of course, not the same question as the one we recently noted as decided in the case, Bourne *v.* Litton, as to apportioning the amount of increase in rent in cases where the landlord is responsible for only a part of the repairs. There, the apportionment, it was held, must be made, or a sum agreed before the increase can be claimed; but this case also raises a somewhat similar difficulty for landlords, for it appears that the only safe course for a landlord to adopt is to get the standard rent determined before he names a rent for any part of the house. For a time at least under the old Act of 1920, it was held that this could not be done unless a dispute arose, see Broomhall *v.* Property Agents and Owners, Ltd. (*The Builder*, November 16, 1921), but now this difficulty has been overcome by Section 11 of the new Act of 1923, but even then the landlord is put to the trouble of applying to the Court to have the standard rent determined, and some expense must be incurred.

Institution of Apprenticeship.

The Countess of Portsmouth was present on December 6, at a meeting of the National Institution of Apprenticeship, held, by permission of the Master, in the Grocers' Company's Hall, and presented indentures and certificates of merit to boys and girls who have completed their apprenticeship.

Colonel Francis W. Pixley, the chairman of the institution, who presided, mentioned that since May, 1905, till December, 1922, 3,205 apprentices had been bound to masters in various trades, and 42 on the latter date were on probation, prior to being apprenticed.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Govan.—The Dean of Guild Court, Glasgow, has passed plans for public halls to be erected in Langlands-road, Govan, at an estimated cost of £25,748.

Muirend.—Messrs. John Emery & Sons have submitted plans to the Glasgow Corporation for the erection of 33 terrace houses at Muirend.

Dundee.—At the last meeting of the Corporation the question of new baths for Broughty Ferry was discussed, and it was agreed that the city engineer should be asked to report on the various sites already suggested, and also regarding the possibility of erecting the baths on the sands.

Edinburgh.—At the last meeting of the Corporation Housing and Town-Planning Committee, at Edinburgh, a letter was read from Mr. R. F. Steele in regard to the proposed erection of 64 houses at Bangholm, and the Committee agreed to grant the ground.—The Dean of Guild Court has passed the following plans: Henry Wade, conversion of two houses in Drumsheugh-gardens; D. M. Bain, four cottages, Longstone-road.

Ailoa.—The Dean of Guild Court has passed plans which were submitted by Mr. James Wightman, Dunfermline, for a case-making factory and sawmill at Caledonian-road. Plans submitted by Patons & Baldwins, Ltd., for 10 houses at Balfour-street, are still under consideration.

Whiteinch.—The Dean of Guild Court, held at Glasgow, has approved of plans for a library at Park-drive, Whiteinch, the cost of which is estimated at £16,365.

Aberdeen. — The Corporation Plans and Sewerage Committee has passed the following plans:—Two houses at Queen's-road West, for Mr. J. B. Craigen and Mrs. T. Wilson, respectively; a bungalow, Pitfodels, for Miss Morrison, Edinburgh; two bungalows, Renfield-avenue, for Messrs. George Taylor, and Robert J. Watt, respectively; two houses in Spur-road, between St. Machar-drive and Tillydrone-road, for Mr. Hay, of Seaton; alterations to premises at 91, Union-street, for the North British & Mercantile Insurance Co. The plans passed for the erection and alterations of buildings, including the above, amount to £13,862 in all.

Selkirk.—The T.C. has received the Board of Health's sanction to the erection of three blocks of four houses each. Estimates are to be obtained for their erection.

Tithe Rent Charges.

On December 6, Mr. Harry Ambler lectured before the members of the Auctioneers and Estate Agents' Institute on "Tithes and Tithe Rent Charges." In the course of his remarks he traced the history of the origin and development of tithes from the period with which the Book of Genesis was concerned down to the first Tithe Act passed in 1836. In all countries, he said, civilised and uncivilised, and throughout all ages, tithes had been paid. The most barbarous nations and the heathen Greeks and Romans, out of a principle of religion common to all men, had often dedicated tithes to their gods. Some had made it a standing obligation. Others had offered them on particular occasions. Tithe as a tax on land was well known in Greece and Rome, and the payment to temples on special occasions was not uncommon. He considered it probable that tithes in this country were contemporary with the advent of St. Augustine. In England legislation on the subject appeared to date from the latter part of the eighth century, when Pope Adrian in 785 enjoined payment of tithe on the Anglo-Saxon Church. This was confirmed in later Ecclesiastical Councils and Synods, sometimes by Royal orders. Before that, however, Offa, King of Mercia, made a law whereby he gave to the Church the tithes of all his kingdom. It was said this was done in expiation for the death of Ethelbert, the sainted King of East Anglia, whom he had caused to be murdered. The effect of this law was to give the Church a civil right in tithes by way of property and inheritance and to enable the clergy to gather and recover them as their legal due by the coercion of the civil power.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers' Labourers.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

✱JANUARY 1.—**Leeds.**—Instructor in Architectural Construction and Design required at the Leeds School of Art in the Department of Architecture. Director of Education Education Offices, Calverley-street, Leeds.

BOOK REVIEWS.

Painters' and Decorators' Materials. By RANSOME W. COOPER, F.C.S. (London: Trades Publishing Co.)

The author of this book states that it is written primarily to help purchasers and salesmen. It contains a great deal of very useful information, clearly and lucidly stated, and it covers a very wide field and includes a chapter on tools and another on brushes. Considerable information is given about the various methods of manufacturing white lead and other white pigments; attention is also drawn to antimony oxide and titanium, the more recently introduced whites. Reference is also made to waterproof glasspaper introduced to the trade for the purpose of eliminating the risk of creating dust, of a type which is supposed to be harmful to the health of the painter and decorator. The advantages of the adoption of this improved method of treating certain work are ably dealt with. Numerous simple methods of testing materials are given; generally these are of a type that make it possible to obtain certain facts without a very advanced knowledge of chemistry. If information beyond the scope of these tests is required the reader is wisely advised to seek the more expert aid of the paint technologist or chemist. Varnishes, driers, oils, and turpentine receive ample attention, and a chapter is devoted to ready-mixed paints. The treatment of cement, prior to painting, is dealt with. We wish we had the same confidence in the method prescribed by Mr. Cooper as he has. A useful chapter is given on materials used for the preservation of wood, and useful formulæ for paint-removing materials are also given. Paperhangers' paste is unfortunately dealt with in this chapter; it would have been better if included with paperhanging.

The remarks on True Cheapness should be widely read; from the proper understanding of this section much trouble and expense might be saved. Formula tables as set out in this book, we think, are only of value as an approximation of what is wanted. Proportions are useless without a standardisation of the strength and colour of the pigments mentioned.

The list of names, technical terms, chemicals, etc., is not the least interesting section though it is not very extensive. Taken altogether the book should prove very useful.

Property Owners' Guide to the Increase of Rent and Mortgage Interest Restrictions Acts, 1920–1923, and Income Tax Acts. By EDWIN EVANS and B. GRAHAM EVANS. (London: Property Owners' Protection Association.) Cloth, 5s.; paper cover, 2s. 6d.

This little volume of 38 pages is described as a Memorandum explaining briefly the Rent Restriction Acts, 1920 and 1923, and also as containing a summary with explanations of the principal Income Tax and Finance Acts up to and including 1923. It takes the form of a general statement of the effect of the Acts grouped under headings printed in large type, and it is therefore easy for the reader to turn to any particular of the subjects dealt with and to gain an idea of the legislation in a very concrete form. Very few references are given to the actual sections of the Acts, but from the layman's point of view this simplifies the subject. It is no easy task to summarise all the provisions of this complicated legislation, and although we have not examined it in detail the work appears to have been carefully done.

We are not quite in agreement with the interpretation placed upon section 3 of the Act of 1923 as given on page 10. That section relates to leases or agreements granted before the passing of this Act, which will determine at some date after June 24, 1923, at a rent reserved which after that date exceeds the standard rent and the increases permitted under the Acts of 1920 and 1923, and it provides that the landlord may by three months' notice, expiring not earlier than December 21, 1923, or later than March 31, 1924, determine the lease or tenancy, provided that if within one month of the receipt of the notice the tenant shall give notice to the landlord that he elects to abide by the said lease or agreement and the terms thereof, then "the said lease or agreement shall remain in full force and effect in every respect including the amount of the rent thereby expressed to be reserved unaffected by the principal Act or this Act."

The authors in connection with this section say, "or if a notice by the landlord is given but the tenant does not elect to abide by the lease or agreement any rents in excess of the standard rent plus authorised increases will not be recoverable from the tenant or if paid by tenant, could no doubt be reclaimed," and it is suggested that the tenant will become a "statutory tenant."

We read this section as giving the landlord the right to determine the lease or agreement provided that the tenant does not elect to abide by it, and therefore that there is only one alternative to the tenant, either to go or to accept the terms of the lease or agreement, but the question is highly controversial, and we only throw this out as a suggestion.

In glancing through this work we notice some very sound common-sense suggestions made by the authors, and for such a very brief and comprehensive summary of most complicated legislation we have little doubt that it will well serve its purpose.

The Modern Sign-Writer. Edited by W. G. SUTHERLAND. (Manchester: 9, Albert-square.) Price 12s. 6d. net.

This is a useful and practical volume, which should be in the hands of all sign-writers and those interested in good lettering. A steady improvement has been taking place in lettering now for some years, but there still remains room for more. The plates are large and clear, and specimens of numerous historic examples of lettering are given. Chapters of practical value, such as "Sign-writers' materials," "Spacing and display" (a very essential one), "Preparation of grounds," &c., and others equally valuable. The illustrations of banners and signs are boldly handled, and will be of considerable use to designers. Here, again, there is room for much improvement, and good signs would be welcomed and appreciated by all.

NEW ROMNEY.—Two houses, at Littlestone, for Messrs. Swan & Joy.

NEWBURN.—The U.D.C. have decided to proceed with the erection of 26 houses at Woodside-avenue, Throckley, and have accepted the tender of Messrs. T. F. Brown & Co., Blaydon. They are to seek to secure permission from the Ministry of Health for a loan of £13,500 for the work.——The Council have also approved plans for a new picture hall in Rokeby-street, Lemington, submitted by Mr. J. W. Armstrong, of Newcastle.

NEWMARKET.—The U.D.C. has approved plans by Messrs. Holland & Son, on behalf of Major McCalmont, for a pair of houses in the Avenue.

NEWPORT (MON).—The Newport Public Works Committee has agreed to grant full subsidy assistance for the erection of 50 houses by Messrs. Lysaght's employees' housing scheme and for 50 houses to be erected by the G.W.R. Co. under its employees' assisted scheme. In addition, subsidy grants for 300 houses have been agreed to in respect to persons building own dwellings.——The T.C. has agreed to pay £5,000 in restoring present ruins of Newport Castle so as to utilise them.——A portion of site is required for constructing new road from Shaftesbury-avenue to Newport Bridge. The Tredegar Estate is being negotiated with for site transfer.——The Parks Committee has decided to allocate £200 for providing a putting-green in Shaftesbury Park.——Lord Tredegar having given site for erection of new parish hall for St. Woolo's (the Pro-Cathedral) has made possible the construction of a western approach to the church and carrying out important improvement at junction of Stow-hill with Clifton-street; the scheme includes building of lych-gate or stone porch; preliminaries to work are proceeding.

NEWTON ABBOT.—Plans passed R.D.C.: Three bungalows at Ogwell, for Mr. J. W. Cox; bungalow at Moreton, for Mr. John Gray; bungalow at Lustleigh, for Mr. Scott Painter.

NORTH BERWICK.—The T.C. recently gave instructions for plans being prepared of new municipal buildings for the Burgh. These have been considered by the Council, but as the estimated cost of the two sets of plans amounted to £37,000 and £39,000 respectively, they have been rejected on the grounds of being much too costly, and instructions have been given the architect to prepare plans of a building to cost round about £8,000.

NOTTINGHAM.—The T.C. has adopted a report of the Estates Committee recommending the strengthening of Trent Bridge and widening it to 80 ft. between the parapets, at an estimated expenditure of £130,000. The Ministry of Transport have intimated that, in view of the important situation of the bridge and the great amount of unemployment which exists, it is prepared to contribute 60 per cent. of the cost of the work, provided that the contracts for the steelwork are placed not later than January 31 next, otherwise the grant will be reduced to 50 per cent.

OSSETT.—Plans passed by T.C.:—House and shop, Dewsbury-road, for Mr. H. Jennings; house, Broomcroft, for Mr. W. H. Knight; house, Belgrave-street, for Mr. Wilson Rigg.

OXFORD.—Plans passed by T.C.: C. Wright, 45, Norfolk-square, London, house, Charlbury-road; City Motor Co., Gloucester-street, three oil stores, Botley-road; Kingerlee & Sons, Queen-street, 23 houses, Oatlands-road; Hinkins & Frewin, Walton Well-road, conversion of timber stores to shops and offices, Canal-street; G. R. Stevens Rewley-road, furniture repository, Botley-road.

PAISLEY.—Plans passed: James Martin Newton, 34, Glen-street, house at Marchfield-avenue, Inchinnan-road; Alexander Morrison, Greystones, Wester Bushes, villa at Wester Bushes.

PEMBROKESHIRE.—The County Small Holdings Committee will, in the new year, erect dwellings on Good Hope, Pallau, Llysyffron and Chapel Holdings, and has decided to ask Ministry of Agriculture to allow larger buildings than formerly sanctioned in view of construction cost decrease.——The Haverfordwest Council is to proceed with repairs to Scolton Villas; the Council has requested new Bridge Commissioners to proceed with repairs to new bridge and its approaches; the Council is to borrow £5,000 to supply new gas mains for Merlin's-hill district.——Plans have been submitted to Tenby Town Council for new garages in Cobb-lane, for executors of late Mr. Robert Lock. The architect is Mr. E. Glover Thomas.

PONTYPRIDD.—The U.D.C. has applied to County Council and Ministry of Transport for assistance toward the proposed work of improving, at estimated cost of £25,000, the Rhondda-road at Trehavod and Gellyfeillon in three localities.——The Council is negotiating for joint erection of a maternity home of large dimensions to serve the Pontypridd, Mountain Ash, Rhondda Valleys and Llantrisant areas, with the Urban District Councils of places named. Failing joint scheme, U.D.C. will construct same on smaller scale for Pontypridd district.

POULTON-LE-FYLDE.—The Poulton-le-Fylde Council have been considering the question of enlarging and improving their sewerage system. The district is increasing rapidly and new roads are being made. The Council have asked Messrs. W. H. Radford & Son, of Nottingham, to report on the matter.

PREESALL.—The Clerk to the U.D.C. has reported the receipt of a letter from the Public Works Loans Commissioners stating that the Council's application for a loan of £19,300 for sewerage purposes would be granted.

RAWDON.—The Ministry of Health has approved of the scheme of the U.D.C. for the erection of 25 houses.

REIGATE.—Subsidies granted by R.D.C.: Mr. H. North, cottage in Mid-street, Nutfield; Mr. E. Heard, bungalow in Meath Green-lane, Horley; Mr. Stephen Wayney, cottage in Rockshaw-road, Merstham; Mr. R. W. Turner, bungalow at Lower Kingswood; Mr. Blackman, two cottages in Buckland-lane, Kingswood; Messrs. Costam & Son, six pairs of cottages in Drive Spur, Kingswood.

SCALBY.—Plans passed by U.D.C.: Two bungalows for Mr. Jowett, Cross-lane, and bungalow for Mr. Moorey; two houses for Mr. F. Baker, on Throxenby-lane; house for Mr. Bonser, Cross-lane; two houses for Mr. Shone; bungalow, Cross-lane, for Mr. Helliwell; six bungalows for Mr. Dixon on new road between Coldy Hill-lane and Green-lane; bungalow for Miss Cummins on new road near to Cross-lane; bungalow for Mr. Tymon on Cross-lane; house for Mr. Brodrick on Field Close-lane.

SHEFFIELD.—The Sheffield Coal Company, whose three collieries lie in the neighbourhood of Woodhouse and Beighton, intends to erect a 100 thoroughly up-to-date dwellings for the occupation of their men.

SOUTH SHIELDS.—The Ministry of Health has sanctioned the borrowing by the T.C. of £39,000 for the development of the south foreshore, by the construction of promenades, shelters, &c.

SOWERBY BRIDGE.—Plans passed: Extensions to making-up department at Stansfield Mills, for Messrs. Wm. Morriss & Sons, Ltd.

STAFFORD.—Plans passed by T.C.: Mrs. M. Larkin, two cottages at Rising Brook; Mr. F. Morgan, house at Rising Brook; Miss E. Geoghegan, house in Stone-road; Messrs. Greenwood & Fell, two houses in North-street.

STOKE-ON-TRENT.—Subject to the approval of the Ministry of Health, the T.C. will grant subsidies of £100 per house in respect of 258 houses proposed to be erected at Hanford.——The Borough Engineer is to prepare plans for a maternity home.

SUTTON.—Plans passed by U.D.C.: Bungalow, Ridge-road, for Mr. J. Romaine; house, The Highway, Banstead Downs, for Mr. A. Wordsworth.

WAKEFIELD.—Plans passed by T.C.: Messrs. Chadwick, Watson & Co., alterations to the Empire, Kirkgate, for the New Century Pictures, Ltd.; Mr. J. R. Lister, two houses in Bromley Mount, for Misses L. and M. Horne.

WALTON (SURREY).—Plans passed by U.D.C.: Miss L. Fitt, alterations, Lodge, Mount Felix; assembly Room for Boy Scouts, Felix-road; C. Lippold, house, Mount Felix estate; Pioneer Works, Ltd., conversion of dwellings to dwelling-houses, Mount Felix estate.

WARRINGTON.—In Ellesmere-street, a church and schools are to be built on the site of the present mission.

WHITEFIELD.—At a meeting of the U.D.C. it was intimated that Messrs. Mark Fletcher & Sons, dyers, bleachers, and finishers, had undertaken to bear the whole of the expense (estimated at £1,200) in the construction of a public bowling green, bowl-house, &c., also that they had given half-an-acre of land towards that purpose.

WHITLEY.—At the last meeting of the U.D.C. plans were approved for several new houses, and alterations and additions to the Royal Hotel, and it was decided to widen Ruswarp-lane at an estimated cost of £2,330.

WIGSTON.—Plans have been approved for the proposed open-air swimming-bath which Messrs. W. Dunmore & Son intend to present to the Council.

WIMBLEDON.—Plans passed by B.C.: Messrs. W. H. Whitehead & Co., house, Montana-road; Messrs. Kinnear, Moodie & Co., house and garage, Parkside; Messrs. H. Wakefield & Sons, three houses, Cambridge-road; Mr. P. D. Hepworth, house, Church-road; Messrs. W. H. Whitehead & Co., house, Montana-road; Messrs. Wenton Bros., two houses, Durrington Park-road; Mr. S. Derwent, house, South Ridgway-place; Mr. C. M. D. Davidson, two houses, Denmark-avenue.

WINCHESTER.—Plans passed by R.D.C.: Bungalow, Nations-hill, Mr. L. G. Howson; Clayesmore School Sanatorium, Mr. A. Devine; Rose Cottage, King's Worthy, Mr. V. A. Thompson; four cottages, King's Worthy, Mr. T. Whitcher; bungalow, Littleton, Mr. S. Shambrook; bungalow, South Wonston, Mr. A. Webster; hall, South Wonston, Rev. Canon W. G. Edwards; farm cottage, South Wonston, Mr. F. Redrup; bungalow, Colden Common, Mr. A. V. Francis; farm cottage, King's Worthy, Mr. J. Maddocks; house, Littleton, Mr. W. Mogridge.

WORTHING.—Plans passed by T.C.: House, West-avenue, Sparks Bros., for A. Black; house, Homefield-road, E. J. Love, for L. F. Passmore; house, Brooklyn-avenue, for A. Clare; house, Lawrence-avenue, Cornford & Son, for Mrs. Harris; house, Grand-avenue, S. H. Burdwood, for E. Hawkins; house, Gerald-road, Hall & Co., for C. L. Hudson; house, St. Thomas's-road, for W. G. Sisman; three houses, St. Wilfred's-road, F. G. Abell, for Worthing Estates Building Co., Ltd.; house, Evelyn-road, F. G. Abell, for J. Lawrence; house, Brooklyn-avenue, for Le Maitre Bros.; house, Evelyn-road, for F. G. Abell; additions to "Villa la Loggia," South Farm-road, Bridger & Son, for J. Potts; two houses and shops, Broadwater-road, T. R. Hyde, for Potter Bailey & Co. and C. Whitcomb; house, Brooklyn-avenue, Le Maitre Bros., for H. J. Freeman; house, Wilfred's-road, J. E. Lund, for W. Parsons; house, Wallace-avenue, F. G. Abell, for Worthing Estates Building Co., Ltd.; two houses, Downview-road, for E. G. Goodall; shop and office, Richmond-road, for Churcher Bros.; house, Pavilion-road, J. Gausden, for W. G. Wyatt.

FIRES.

SHEFFIELD.—A disastrous fire has occurred at the extensive premises of Messrs. Loxley Bros., Ltd., letterpress printers and stationers, at Aizlewood-road, Heeley.

We hear from Messrs. Chas. P. Kinnell & Co., Ltd., that they have added an extensive showroom at Southwark-street, where they exhibit the most modern types of heating and domestic supply boilers, combined boilers and cookers, radiators, and other heating requisites for all purposes.

EXPANSION OF BUILDING AND CONSTRUCTION IN INDIA.

(FROM A SPECIAL CORRESPONDENT.)

FACILITIES FOR INDIAN TRADE WITH ITALY.—The Royal Italian Commercial Attaché in Bombay has informed the Indian Merchants Chamber that the Chambers of Commerce of Milan, Genoa, Naples, and Venice will give every assistance to Indian merchants desirous of doing business with Italian firms, and an Italian officer knowing English will be placed at their disposal. Letters of introduction will be issued by the Attaché in Bombay to Indian merchants visiting Italy. With the object of having a reciprocal guarantee of the reliability of the firms, the Chambers of Commerce enumerated will co-operate.

INDIAN TARIFF.—The defects of the Indian economic system affects the Indian tariff problem. Indian industrial labour is unskilled, being mainly recruited from the agricultural classes, and suffers from the want of technical knowledge owing to the lack of schools for training apprentices. It has been suggested that firms supplying, whether within or without India, should afford facilities for the technical training of Indian apprentices. The lack of organisation is a defect common to all the Indian industries. The scarcity of Indian capital for industrial enterprises, which the native often views with suspicion, demands the free utilisation of foreign capital and foreign resources.

PORT EXTENSION PROCEEDING.—During 1922-3 Bombay Port Trust expended a total of £1,639,316, as follows: £464,000 on new dredging plant, £421,600 on Mazagaon cotton depot, £173,300 on constructing Bombay oil pier, £110,000 on rolling-stock for Port Trust Railway, £82,900 on plant for reclamations at Mazagdon, Sewrig and Wadala, £42,000 on staff buildings. The Port of Calcutta expenditure showed—work on King George's Dock scheme £812,327 (bringing the total expenditure up to date to £1,856,014), the new 80 ft. lock entrance, Kidderpore Docks, £64,221, cost of R.I.M. Dockyard £483,197, No. III Calcutta Jetty Reconstruction £22,712.

LOCAL ACTIVITY.—Bombay contractors are pushing improved concrete mixers, electric and mechanical ornamental lifts for buildings, stocks of steel beams. In Calcutta agents hold over 3,000 tons Scotch iron and steel joists, beams, rounds, channels, plates, squares, angles, tees, &c., of all sizes and sections to British Standard Specification. Scotch waterworks appliances are held in Bombay and Calcutta. Refrigeration and ice plants, water coolers, &c., are being introduced from Bombay, Calcutta, Karachi, Madras and Ahmedabad: cold storage has a great future. Reinforced concrete is being pushed as the building material of the present and future, permanent and fire resisting, for theatres, go-downs, mills, offices, workmen's quarters, factories, piers, workshops, bungalows, blocks of flats, foundations, railway sleepers, &c.

INDIAN TOPICS.—On September 30, 1923, the percentage of Indian metallic reserve to circulation was nearly 68. Mr. J. Mercer, Deputy Consulting Architect to Bombay Government, has been posted to work under the Consulting Architect to the Government at Bombay.

LOCAL BUILDERS' DEFECTS.—The Calcutta City Architect recently held an enquiry into the collapse of the Mohammedan Orphanage, and the conclusions were, *inter alia*, the employment of inexperienced advice, the faulty supervision of construction, the unsatisfactory qualities of materials used, the carelessness displayed throughout the construction, bricks were used but no mortar, the dangerous loading of columns on the second story where walls once were, and a disregard of regulations, &c.

BOMBAY PAVEMENTS.—The misuse of Bombay pavements has been criticised and builders have been included. When houses are pulled down the old materials occupy the pavement, and new building materials are dumped on the roads and available pavements.

THE "ZOO" AQUARIUM.

The illustrations on this page show front and back views of the slate tanks in course of erection at the new aquarium at the Zoological Gardens, before the addition of imitation rock work will eventually conceal them. The tanks are 56 in number, many of them being 16 ft. 9 in. by 5 ft. by 5 ft. deep outside dimensions. Their thickness is generally 2 in. and the total weight about 100 tons. They are constructed with very large slabs, all of the best Welsh slate, and were made by Bingley, Son & Follit, Ltd., at their London works and put together by them on the site. Mr. J. J. Joass, F.R.I.B.A., is the architect.

Slate Tanks at the New Aquarium, Zoological Gardens. Mr. J. J. Joass, F.R.I.B.A., Architect.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED 'THE BRITISH ARCHITECT."

L. CXXV.—No. 4220. DECEMBER 21, 1923.

COMMERCE AND ARCHITECTURE—I.

A FEW weeks ago we dealt in a leading article with some fallacies which, in our opinion, are a hindrance to a logical development of commercial architecture. We dealt with the subject from an economic or utilitarian point of view, believing as we do in ostract value of ideas quite apart from their momentary nce over the minds of architects. We were fully conscious many artists could maintain that their conception of rchitecture could not be associated with anything less a noble ideal. We would not attempt to prove that rn civilisation is essentially more commercial than at periods in the history of our development as a nation, ould we attempt to analyse the philosophy which seeks ove that the pursuit of commerce is not a noble ideal. nation which has subscribed in hundreds of thousands nds for war memorials in its churches and public places itten down as being commercially minded, when it could built in a time of acute shortage many houses for crippled rs to live in rent free, or maintained a fund to keep them want during their lifetime? It may be some other e which prompts each of us to have a cenotaph for our ity, but it is decidedly not a commercial instinct. What ttempted to show was the difficulty which confronted architect if he attempted to formulate a code of com- al ethics neatly graduated for various forms of archi- al expression. Probably it would be more correct to say it is the absence of clearness of thought and reasoning obscures the true motive of architecture and robs it of gracefulness and force which proceed from any logical opment.

e are not thinking of the subject from the point of view e architectural critic—though it would be a desirable to have some common ground of criticism; we are ing of the attitude of the designer in relation to his subject, f the possible effect upon the building. The problem be developed a stage further if we were able to separate r minds the hackneyed conception of the "commercial" ok of the business man from what we conceived should e forms which commerce should develop in its buildings. ttempt has often been made and always it would appear conclusions are hopeless. Where architecture is to be at its worst we attach the blame to the commercial nt, yet when we see a commercial building adopting n architectural symbols and expressing itself with dignity suggested that architecture has become a means of adver- ent for the proprietor or his goods. The architect ently escapes with his philosophy intact, although it is certain that many of the early commercial buildings it the architect playing a losing game in his attempts to romise by forcing his limited vocabulary of traditional archi- al features to adapt themselves to modern requirements. is ample evidence in our streets to show that there is a r and more uniform standard of architectural design upon fundamental principles which are gradually being stood; yet we return full circle and begin to wonder is wrong with it because it is good! An instinct for romise is often claimed as an essential characteristic of the sh mind, but an architectural compromise is easier to stand than bad metaphysics.

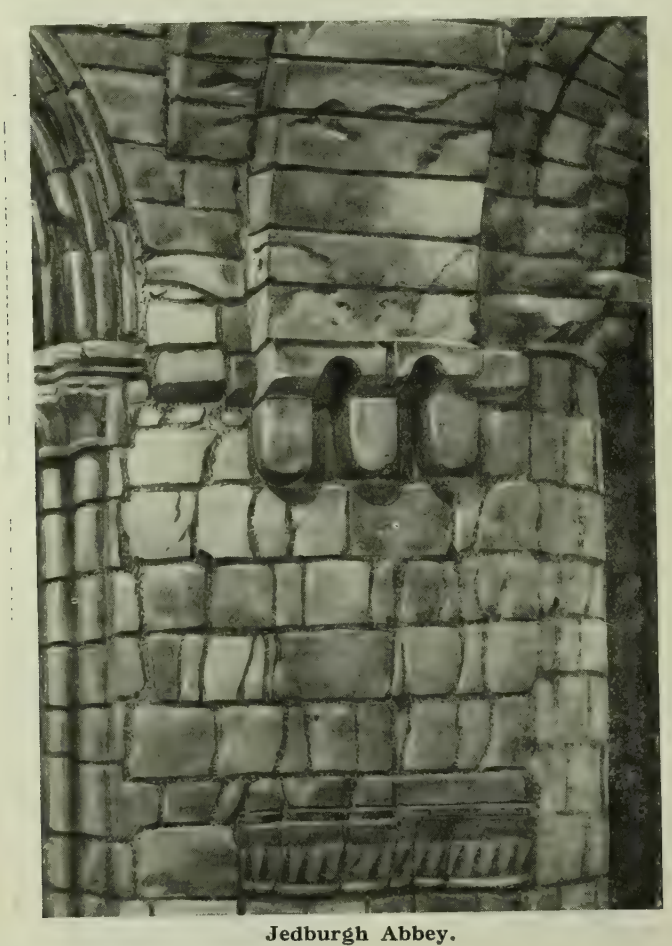
o point is served by caricaturing the architectural effects mmerce upon architecture. The skyscraper, for instance, sents a social development (or anti-social, as the case may nd is not necessarily the ideal of the commercial mind. The architect can hardly attach the whole of the blame to commerce if an architectural jumble is the result, since we cannot assume that he is powerless in his efforts to restrain his client's weakness for irrelevant sky-lines and domes, or a modern emporium designed in the mediæval style.

It is difficult to imagine an architect accepting responsibility for a design of which he secretly or openly disapproves; it is truer to life to say that he may either be glad to be associated with the building or that he has never worked out in his mind the philosophy of architecture in relation to twentieth-century needs. It is not always the business man whose mind hankers after towers and angle-turrets; the architect has been known to enter with zest into the gentle game of dwarfing a neighbouring building competing against his client. Architects have it in their power to curtail abnormal developments in commercial architecture, but first they must see to it that they do not neutralise their efforts by accepting ethical standards which they cannot logically defend.

It seems an impertinence to discuss the compelling emotion that prompts the erection of most buildings to-day with the sentiment that poised the Wingless Victory over the Acropolis of Athens, or reared the mighty dome of St. Paul's and the cathedral at Salisbury. All that can be said is that the theory of art for art's sake is difficult to maintain in our present civilisation, and particularly in a creative and structural art such as architecture. A study of elementary economics teaches us that in the very dawn of things when the people came upon a supply of food which was abundant and certain and easily obtained they had time and energy left over to devote to the satisfaction of other needs. We have not space to develop the relationship between these early expressions of art and current theories upon the artistic impulse of to-day, but we can safely say that the whole system of architectural training is opposed to the idea of architecture developed and expressed by the individual as a spare time hobby. Every age has its own expression, whether we agree with the particular tendency or not, and architects cannot hope to alter the development of civilisation by pretending to ignore it.

It is evident that architecture must be paid for, regardless of the abstract qualities which the building or the architect seeks to express; hence the need for the architect to analyse for himself the sources of money, and settle his doubts about the morality of the transactions which produce money and reproduce art. There is clearly a doubt in the minds of many architects concerning the ethical position of commerce when it desires to express itself through architecture, but the difficulty is apparently removed when commerce leaves a sum of money to the nation to purchase pictures and a building to accommodate them. The inference which is suggested is that fine architecture can only be associated with intellectual profits and dividends!

Twenty years ago the narrow-frontage building of many stories pretended to be supported by an arch which, from the thinness of its abutments, probably deceived nobody. It was designed by an architect (let us be just), but the shop-fronts of that period seemed to be designed as an afterthought by anybody. To-day, there is a vast improvement in the expression of logical construction, and the shop-front—though still an unfortunate element in the design of the building as a whole—is at last being treated with dignity and grace. Having got so far and recovered so much lost ground, is it wise to arrest a development which at least has truth and logic behind it by trifling with ethical commercial values upon which it is evident none of us is competent to judge?



NOTES.

Lloyd's. AFTER one hundred and forty-nine years at the Royal Exchange, Lloyd's, the world-famous insurance corporation, is to move its quarters to Leadenhall-street. Sir Edwin Cooper, F.R.I.B.A., has been appointed their architect, and has prepared preliminary studies for the new premises, which it has been our privilege to see. At a glance one is immediately struck by the admirable directness of the scheme, a directness which can only be attained by much experience and by a master designer. The preliminary studies for the elevations are also well considered, with an excellent sense of proportion. The main portion of the new building will be behind the new buildings west of Leadenhall-street entrance, with a frontage to Lime-street. In the near future we hope to illustrate this important addition to London's new buildings and architecture.

Values. THERE is, of course, an explanation to be found for the purchase of a print at Christie's, on Tuesday, for £3,045. But an explanation is hardly an excuse. We are very busy establishing "records" nowadays, but the enduring values in life are lamentably at a discount value. We shall, before long, have to send in our votes for the building which is worthy of a gold medal if we are interested enough to take the trouble. We wonder if those whose opinion is worth anything will all take the trouble to vote? A good many people could name two buildings which deserve a gold medal, but they were built before the gold medal era set in.

Higher Buildings. THE evidence against sky-scrapers is accumulating, and it must be a question for the serious consideration of London authorities whether the erection of very lofty buildings in the City is desirable or not. We must all agree that some real foresight should be exercised about this, and that the general health of the inhabitants and the preservation of some degree of amenity are matters that must have their place alongside the merely economical considerations.

An Academy Committee. THE Committee which has been formed by the Royal Academy, of artists and scientists, for the investigation of the qualities of artists' materials and to inquire into the methods of cleaning pictures, is a step much needed; in fact, long overdue. The ravages of the picture restorer, ungoverned by control, with methods kept secret himself, have done immense harm, the purpose of this Committee—and a very representative one—is to r some general agreement, with the that until their decisions are publi the owners of old pictures will, so f possible, postpone any plans for restoration or cleaning of them w they may have in contemplation. Committee offer a number of very val suggestions, pointing out that the dec to clean or repair a work of art ough to rest on the judgment of a single but should be a matter for open cons tion with artists and scientists who especially studied the subject; and no countenance should be given to s methods. In such a matter the a of artists will be of special value, as not only a matter of the materials t selves, but of their method of applic which determines the possibility of can be done. To take the case valuable painting which the artist painted in bringing it to completion delicate glazes of colour, the rest methods may remove these altog in the process of cleaning unless has been a careful appreciation o methods through which his results reached. We notice from time to accounts appearing of old masters w have been "discovered"; and w after restoration, are expected to re high price. It will be a good thing there is an authoritative body ab watch over these things, for it is "trained artistic sense" which much required for these matters. Committee includes Sir Aston W Messrs. G. Clausen, J. D. Batten, Heaton, and others, and in undert this inquiry they are doing a most u and necessary thing.

Jedburgh Abbey.

SKETCH BY MR. WILLIAM HARVEY OF PART OF NORTH-WEST PIER OF TOWER AFTER COMPLETION OF THE WORKS OF REPAIR. (*See p.* 965.)

[The stones of the Norman pier have been retained with all their historic fractures. The interior only was renewed with reinforced concrete.]

Society of Arts Competition. WHILE reciprocating public-spirited effort the Society of Arts t prove industrial desig are left in some doubt as to how such competitions effect the pu they have in view, though wishing this may result from it. It will de no doubt, very much in the choice of those who are to adjudicate o matter. But there is another th Surely a certain danger lies in distrib diplomas which "come to be kno conferring a definite and generally nised status as a designer of the rank." Such official recommend are not always of the same service t arts that they are to individuals, perhaps the present age is a little illusioned in regard to such claim we could feel that the possession of diplomas secured invariably such a s then, of course, the more of the better. The more diplomas the g

RICE B. ADAMS, F.R.I.B.A., ARCHITECT.)

number of first-rank designers. But as easy as all this? Are the machinery good intentions of the Society of Arts icient to secure all these benefits for At this time we do not hold with certainty that design can best be ered in such a way. We need to be ful lest in our desire to raise the ndard of industrial design we forget difficulties lying in industrialism lf, which has its own standards, not ays those of art. The aim to en- rage better design in order to sell the ds, the application of art to industry, ess considered in the light of the lterable claims which art makes upon —whether it sells the goods or not— uld remind us of the difficulty of ting the two together. For to unite m we must identify their objects re nearly, the spirit which informs h the designer and the industrialist st be a mutual one, and we must ieve in beauty for its own sake, not to low our business.

"Period" Rooms.

WE note that in the furniture section designs may be submitted "for the furnie of a modern dining room in Adam le." We are rather sorry to see this, we had supposed the purpose of this mpetition to be the encouragement of lustrial design, and "Period" rooms surely needing none at the present ie, nor will industrial design be fostered working over again this exhausted ound. To reinforce "Adam" interiors th diplomas were to discourage the ry object we imagined the Society had view. The student should be directed ay from all these derivative and second- nd inducements, and be encouraged to ply his abilities in such a way as will eate for industry new identity and ness to be the beautiful expression of wants of our own time.

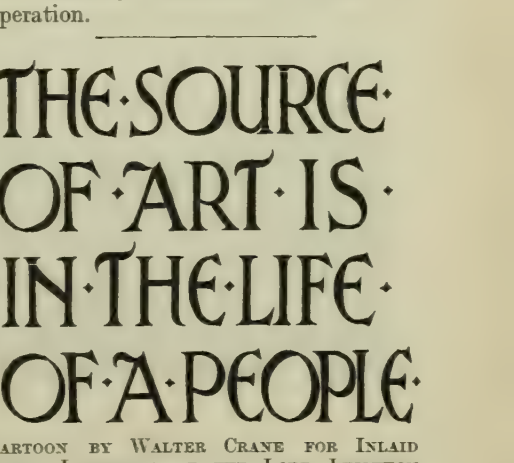
Design and Industrial Design.

MUCH is being advanced just now about industrial design, but we need to be careful in our definitions. sign is all of one nature, though its plications are so many, and because are considering it in its relation to lustry it does not alter its nature. If we got to think that industrial design were one thing and that there were some other we should be in danger of separating things which cannot be divided. Industrial design is felt to be inadequate, often very bad, and we reciprocate the efforts now being made by the Society of Arts to improve it. No compromise will, however, aid us which wars against its nature. What the public wants, or is supposed to want, has little enough to do with it, and if, for instance, the chocolate box manufacturer really wants better design, he must want it for its own sake, must have faith and appreciation enough to believe in it. Otherwise we shall only reach what is already happening with architecture, where a "salesman's architecture" and other architecture are seen to have been separately inaugurated. It is our good faith in beauty which will improve industrial design, and not merely the desire to make use of it to push sales, and this will do more for us than ten thousand diplomas without this governing requirement. The aim to add the prestige of beauty to our industries is no less proud than difficult, and one which will need a faith commensurate with it.

The A. A. Conversazione.

THE annual conversazione of the Architectural Association took place last week at Bedford-square, where the president, Mr. E. Stanley Hall, M.A., F.R.I.B.A., and Mrs. Hall, received the guests. There was a large attendance. There is much to be said in favour of these social gatherings, giving as they do an opportunity to meet old friends and exchange ideas. Many members who attended the A.A. Avignon excursion met again and had reminiscences to tell, while other matters of professional interest were not forgotten, especially the A.A. play, "So this is Architecture," and the place of meeting of the next annual excursion. Mr. Yerbury had arranged an admirable musical programme for the early part of the evening, followed later by a dance. On the walls were hung members' holiday sketches and photographs of the Avignon trip.

Preservation of Old Buildings.



To the small, but appreciative, audience which attended Sir Frank Baine's lecture at the Society of Arts last week, the fine photographs of old abbeys, &c., which showed the old buildings before and after preservation, the thought must have occurred that from the purely artistic point of view the preservation was rather disastrous. The record of architecture is, of course, preserved, but the effect left us is rather that of dead bones. It is possible that most people will consider it better to preserve, but we must all admit that we lose a vast deal in the process. But as things are the final word is, of course, preservation.

A Professional Tribute.

IT is not given to many men to take a leading part in the representation of the affairs of an important profession for nearly 50 years, and the fact that Mr. Maurice B. Adams, F.R.I.B.A., should have been associated with one of our contemporaries for such a period is an event of sufficient interest to deserve suitable recognition. In this belief a few of his friends arranged a luncheon in his honour this week at Simpson's, when some interesting speeches were made in reference to his conspicuous service to the profession for many years as an architectural journalist and his stimulating influence with a large number of students in architectural design. The opinion of a well-known architect, who was unable to be present on the occasion, that Mr. Adams had deserved and gained the affectionate regard of all who had been brought into intimate contact with him, was heartily endorsed, as was the hope that he would write his reminiscences —remarks with which we gladly associate ourselves. We understand that the luncheon was not intended in any way to anticipate a more widespread and public recognition of Mr. Adams' services to the profession, which it may be intended to arrange. It is always pleasant to see a friendly gathering arranged to pay a tribute of regard to a fellow worker, and Mr. Maurice B. Adams must have appreciated the sincerity of feeling which prompted this mark of esteem.

A Bristol Movement.

WE understand that the Kyrle Society in Bristol has arranged with the Royal West of England Academy for a series of lectures to deal with local buildings. These lectures are to be given by the Academy Students to the Secondary School children. The idea is wholly admirable and reflects the greatest credit on the energy of the Society and also on the Academy authorities for their co-operation.

CARTOON BY WALTER CRANE FOR INLAID FLOOR LETTERING AT THE LORD LEIGHTON MEMORIAL ART SCHOOL, CAMBERWELL. (MR. MAURICE B. ADAMS, F.R.I.B.A., ARCHITECT.)

GENERAL NEWS.

Professional Announcements.

Mr. Williams Ellis, of 22, South Eaton-place, is moving his main office to the old Viscount Milton School, 22B, Ebury-street, S.W. 1, on January 15.

The address of Mr. W. Allison, A.R.I.B.A., architect and surveyor, is now 50, Rathbone-place, London, W. 1.

Mr. Victor H. Wilson, architect and surveyor, 91, London-road North, Lowestoft, has taken over the management of the Architectural and Surveying Department of Messrs. P. Chase, Gardener & Co., 269, High-street, Hounslow.

Prix-de-Rome Scholarship in Sculpture.

Mr. David Evans, A.R.C.A., of Chorlton-cum-Hardy, is the winner of the Prix-de-Rome Scholarship in Sculpture.

Bartlett School of Architecture.

Three entrance scholarships tenable in the School of Architecture and two Bartlett Exhibitions are available for award to students entering the School in October, 1924. The value of these scholarships and exhibitions is not less than £40 a year, tenable in some cases for three years and in some for five. The value of any scholarship may be increased if the circumstances make such a grant necessary.

Year's Work of the Road Fund.

The report of the administration of the Road Fund for the period April 1, 1922, to March 31, 1923, was issued recently. The year was one of great activity all over the country in matters connected with highway and construction improvement. The appropriation (1923–4) will include £9,000,000 as grants to maintenance and improvement of class 1 and class 2 roads. In addition to the sum named a further amount of £1,533,000 will be provisionally set aside as a contribution to the cost of the proposed new Liverpool-Manchester road.

Modern Developments in Town Planning.

A lecture was given at the Engineers' Institute, Cardiff, on December 13, by Professor Abercrombie, M.A., A.R.I.B.A., of Liverpool University, on "Modern Developments in Town Planning." A large attendance of members of the Institute of Builders (South Wales Branch) and of the South Wales Institute of Architects, under whose joint auspices the lecture was delivered, was presided over by Mr. T. Alwyn Lloyd, F.R.I.B.A. The lecturer appealed for greater development of the æsthetic element in town planning in contrast to the now too frequent practice of sweeping away all natural advantages or associations of historic interest. Where there was available natural advantage it should be made use of in framing town schemes and development. Cardiff Castle, in the centre of a busy city, made a pleasing contrast to many places. Lantern illustrations of æsthetic elements in ancient Grecian planning were given and instances of modern endeavour on these lines shown. The consequences of neglect, such as was productive of the "Grid-iron" of New York, were also illustrated.

Victoria and Albert Museum.

The Department of Woodwork of the Victoria and Albert Museum has recently received a gift of a set of three chairs, for the Master, Senior Warden and Junior Warden, respectively, of an old lodge of Freemasons constituted in 1730, and meeting at the "White Bear," King-street, Golden-square. The chairs, now exhibited in Room 57 of the Museum, are about the date of the original lodge. These chairs illustrate the period of transition from the later style of Queen Anne to that of the earlier productions of Chippendale. They have carved and modelled claw-and-ball feet, backs with scrolled terminals and centre splats also carved. Each chair is inlaid with the emblems appropriate to the Master and Wardens, and the set forms an addition to the series of chairs made for special purposes, now drawn together in the same room. These include the chair of the President of Lyons Inn, which has for some time been in the collection; a characteristic example of a Chairman's chair in the style of Robert Manwaring of about the year 1760; and another in that of Robert Adam (*c.* 1770) with shield shaped back of French type, and carved vase with garlands and guilloche ornament—the two latter being recent acquisitions. The Department has also acquired a reading table of carved mahogany, with square top resting on tripod stand terminating in scroll feet, the top being hinged so that it can be raised to form a reading desk, and with four drawers providing compartments for pen and ink. This table was, with other furniture, made in 1770 by William France for the library at Kenwood, under the supervision of Robert Adam, who built the house for Lord Mansfield. The bill is still in existence, and shows that France received the sum of £6 14s. for the table now in the Museum (Room 56).

COMPETITION NEW

Dunfermline War Memorial.

FOR THE DUNFERMLINE WAR MEMOR COMMITTEE.—Designs for a monument to erected at a cost of £3,000. On receipt £1 1s., which will be returned on receipt a *bona fide* design, competitors will rece conditions of competition, plan of site, photographs of surroundings. The assesso Sir John J. Burnet, A.R.A., R.S.A. Sendin day, January 1, 1924.

Swansea Masonic Temple.

In this competition, the assessor, Mr. Art Keen, F.R.I.B.A., has made the follow awards: 1, Messrs. Willmott & Smith, 4, Pa place, Cardiff; 2, Mr. A. F. Webb, M.S. Blackwood, Mon. The design placed first given in this issue.

Industrial Designs.

The Royal Society of Arts will hold a c petition in June next year, at the Victoria Albert Museum. Over £1,000 will be offere prizes. The competition, open to students British schools of art, and all British subje will be divided under the following hea Architectural Decoration, Textiles, Furnit Book Production, Pottery and Glass, and M cellaneous.

Full particulars of the competition may obtained from Mr. G. K. Menzies, Secret Royal Society of Arts, John-street, Adel London.

Other Competitions.

Other competitions still open include following (the dates given are, first the sendi in date, and second the issue of *The Builde* which full particulars were given):—Singap College (Jan. 1, 1924; March 30). Duc Memorial (Jan. 5, 1924; Sept. 14). Memor to the Missing (Jan. 1, 1924; Aug. 3). N castle Concert Hall (Feb. 1, 1924; Oct. Essays on Concrete (Dec. 31; Nov. 16). Bel Union Heating and Lighting (March, 19 Nov. 9). Essays on Heating and Ventila (Mar. 31, 1924; Nov. 9). Monument to Wilfrid Laurier (April 3, 1924; Dec. 14). Ho side Hospital (Feb. 14, 1924; Dec. 14).

MEETING.

SATURDAY, DECEMBER 22.

London Society.—Visit to Trinity Ho 2.30 p.m.

Southport War Memorial: The Monument.

MESSRS. GRAYSON & BARNISH, FF.R.I.B.A., AND MR. A. L. MCMILLAN, A.R.I.B.A., Joint Architects. (*See p.* 964.)

From a Drawing by MR. LEONARD BARNISH. F.R.I.B.A.

CORRESPONDENCE.

Strand-on-the-Green, Chiswick.

Sir,—Notices have recently appeared in the ess to the effect that the new embankment ll recently erected by the Chiswick Urban strict Council has been made to conform with wishes of the Art Standing Committee of the I.B.A. by the addition of a wide splayed oing, well weathered and projecting each side. rther, that the R.I.B.A. has thanked the iswick U.D.C. for the consideration shown to Institute's wishes. The first part of this tement is so wide of the truth that the facts ould be made known generally, as follows:—Early in 1923 the attention of the Art Committee was called to the fact that the Chiswick D.C. was about to rebuild a portion of the bankment wall at the above. In view of nsiderable anxiety which was being shown by al residents and other members of the public to the Chiswick Council's intentions, the Art mmittee approached the Chiswick Council on matter. After repeated enquiries over a riod of three months or so the Chiswick D.C consented to an investigation of their oposals.

Thereupon the Art Committee appointed three its members, of which I was one, to meet the resentatives of the Chiswick U.D.C. and cern public-spirited residents of the neighbourod on the site, when it was found that the rk was already considerably advanced, and owed a portion of the wall completed and ed with random rubble masonry of a very ly and mechanical appearance. It was plained that the wall was to be finished with iron spiked unclimbable fence.

Following discussion, the representatives of Chiswick U.D.C. agreed to the suggestion of representatives of the Art Committee that remainder of the wall facing should be of old ck bricks—of which the Council had plenty their yard—of the character shown in parts the old river walling, that the parapet should finished with a plain thin stone coping, and t the railing should be omitted.

Some months later the R.I.B.A. was informed the Chiswick U.D.C. that they were unable secure the necessary adjustments in their ntract, and that the work was being continued ording to their original scheme. In view of s, a statement explaining the Institute's ion in the matter was published in the *rnal* and, I believe, in the Architectural and neral Press.

Since the recent references to the matter in Press I have visited the site and found the rk completed in the original ugly random ble facing, pointed in cement with a sort of ineering joint, and capped with a mechanily square and smooth stone coping, 14 in. by in. in section, which does not project over, t is even a little narrower than the parapet ll. The effect is that of a slice of rather rich m cake with a generous slab of almond icing it; the R.I.B.A. evidently thinks with me this, for it has swallowed it whole.

The *Chiswick Times* of November 16, 1923, s that the letter from the R.I.B.A. states: . . the work as now executed by the Chiswick ncil at Strand-on-the-Green entirely meets views of the Art Standing Committee." ving now seen the wall, I regard this statent with the greatest astonishment.

Until one remembers that the composition of present Art Committee is not the same as t of 1922–23, it is difficult to understand its lings of approval and gratitude towards the iswick U.D.C., and as one of the three repretatives of the Art Committee of 1922-23 I sh to dissociate myself entirely from any such nplacement.

To put the matter in a nutshell, the Chiswick D.C. has snubbed the R.I.B.A., and the I.B.A. has thanked the Chiswick U.D.C. for ing so.

Arthur Welford.

Cambridge Collegiate Buildings Committee.

Sir,—I did not intend to enter into this ntroversy again, but I notice a number of your correspondents assume that the conditions of the Cambridge competition were broken by the winners.

Anyone who has seen their design and has studied the conditions will know that that is not the case. Statements to the reverse effect were originally issued to the Press by a group of the beaten competitors, but on the very points they raised the conditions were in each instance permissive. The fact that a different impression has evidently got abroad is exceedingly unfair to the winners. I would suggest again that the matter is one which clearly calls for the intervention of a Committee of the Institute, Practice, Standing or Competitions, whichever may be the competent authority.

C. H. Reilly.

Liverpool.

The Pupils of Sir John Soane, R.A.

Sir,—An excellent and complete list of Soane's pupils was compiled and published by Mr. Arthur T. Bolton, F.S.A., F.R.I.B.A., and it may interest your readers if we consider what became of at least some of them.

Mr. E. Foxhall, D.S. St. George, Hanover-square, was present in January, 1845, at a meeting of London District Surveyors, with a view to forming an association for mutual assistance and support. He was afterwards Hon. Treasurer of the District Surveyors' Association until 1858, when he resigned his District.

Mr. J. H. Good was District Surveyor of Poplar, and was later joint architect for the Orphan Clergy School at Leatherhead.

Mr. J. M. Gandy, A.R.A., became a frequent exhibitor at the R.A., and Mr. D. Mocatta became a well-known architect, while Mr. C. J. Richardson became noted as an architectural artist.

Sir R. Smirke, R.A., obtained a number of commissions for good jobs, and Mr. George Wightwick published one or two books.

The works of Mr. George Basevi are well-known to the Fitzwilliam Museum at Cambridge, &c. He fell from the roof of Ely Cathedral and was killed.

Many in the list did not reach a conspicuous position.

Henry Lovegrove.

The Story of a Lake.

Sir,—The article in *The Builder* of Dec. 7, under the heading of "The Lake in St. James's Park—Past and Present," is very interesting, and to me it is particularly so because my old friend The Lake in St. James's Park is referred to.

The ways of H.M. Office of Works are, at times, inscrutable. When War huts were sorely needed in London the site of this Lake was selected upon which to build the huts, involving, of course, the draining off of the water. After the Armistice these huts remained until the pressure of the Press emptied them of their occupants, and thus put an end to those delightful little episodes, which I used to see, where pretty little flappers tripped from one hut to another, about 11 a.m., with cups of cocoa for the sustenance of their Cuthberts who had been working strenuously for nearly half an hour.

Then came the refilling of the lake, and, after the clearance of the huts, the "Department" exercised its usual skill in showing "How not to do it." All that was really needed was to fill in the fissures with puddled clay, let in the water from the various pipes which supplied the lake, and thus give back to the public the old delights of the Park.

This course, however, was not adopted, and after many attempts to "make the flesh creep" and sundry scientific admonitions, what we now know was executed, and the work consists of:

(1) Preparation of the old bed of the lake for its future covering.

(2) A core of hard good old bricks broken up for the purpose.

(3) Layers of gravel and concrete.

(4) Two layers of steel reinforcement of ½ in. rods, laid in squares of about 12 in.

(5) A layer of concrete about 3 in. in thickness.

(6) The finished surface of cement.

It may be that this new bed will resist the boating pressure which may hereafter come upon it, and the cost to the taxpayers has only been about £50,000.

Wm. Woodward.

Criticism Permanent and Passing.

Sir,—It is true that introspection and expression are not commonly equally intended by the same individual; but that introspection has any inimical effect upon expression—beyond this: that the thinker primarily engaged in exploring the depth of his person is tempted to prolong the line inward further than he projects it outward—I cannot conceive. Complete thought, I assume, runs inward and outward in a straight line. Incomplete thought may be represented by any figure that is not a straight line. But, whatever its external configuration may be, it is but opposite in direction and capable of equal extension to that which is internal. It is, I hold, axiomatic that the depth to which we descend conditions the height to which we are able to climb—though not the height to which we do climb.

Thus the artist expresses externally the result of his criticism of works of art by a work of art. The Parthenon is criticism of the Doric, superior to any words that have or can be written upon Doric art. So the literary criticism of literature is the most nearly perfect and simply apprehended of all forms of verbal criticism.

The verbal criticism of the arts other than literature, even when the author is himself an artist in a sphere other than words, represents externally a line that internally may be conceived as parallel but not coincident with his other expressive line. If it were actually coincident the external manifestation would be alike in kind and co-extensive—that it is not makes it clear that it is not the same line.

The very employment of words to transmit thought is but a makeshift. Thought can only be apprehended by thought.

Dudley Harbron.

Hull.

Society of Chemical Industry.

In connection with the report in our last issue of the papers read by Mr. J. Allen Howe and Mr. J. J. Fox, at a meeting of the Society of Chemical Industry, Messrs. Szerelmey, Ltd., state: "As it is commonly recognised that water is the chief cause of the decay of stone, it appears that the safest method is one which provides an impenetrable membrane without casehardening the stone. Surely the free breathing of the stone on its outer face is a very minor consideration compared with keeping out water and its accompanying deleterious agents."

Can Tarnishing Be Prevented?

Sir,—With reference to the above appearing in last week's issue of *The Builder*, it is my opinion that the only way to keep silver goods correctly, and also to save labour, is to first of all to clean the silver thoroughly with some good plate powder, and then to add more plate-powder and leave this second application to dry on the goods and to be brushed off, and the silver re-rubbed with a chamois leather the next time it is wanted.

D. R. Broadbent, A.M.I.E.E.

London.

Sir,—The only way to prevent tarnishing is to keep the silver in airtight cases. One of the worst cases of tarnishing in my fifty years' experience was at a goldsmith's, at Exeter. Here the River Exe runs under the shop windows and the silver had to be taken out every ten days and cleaned. In 1897, Messrs. Vale Bros., of Weston-super-Mare, received an order to make the windows airtight; since then there has been no trouble whatever with the silver goods.

Edward Vale.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

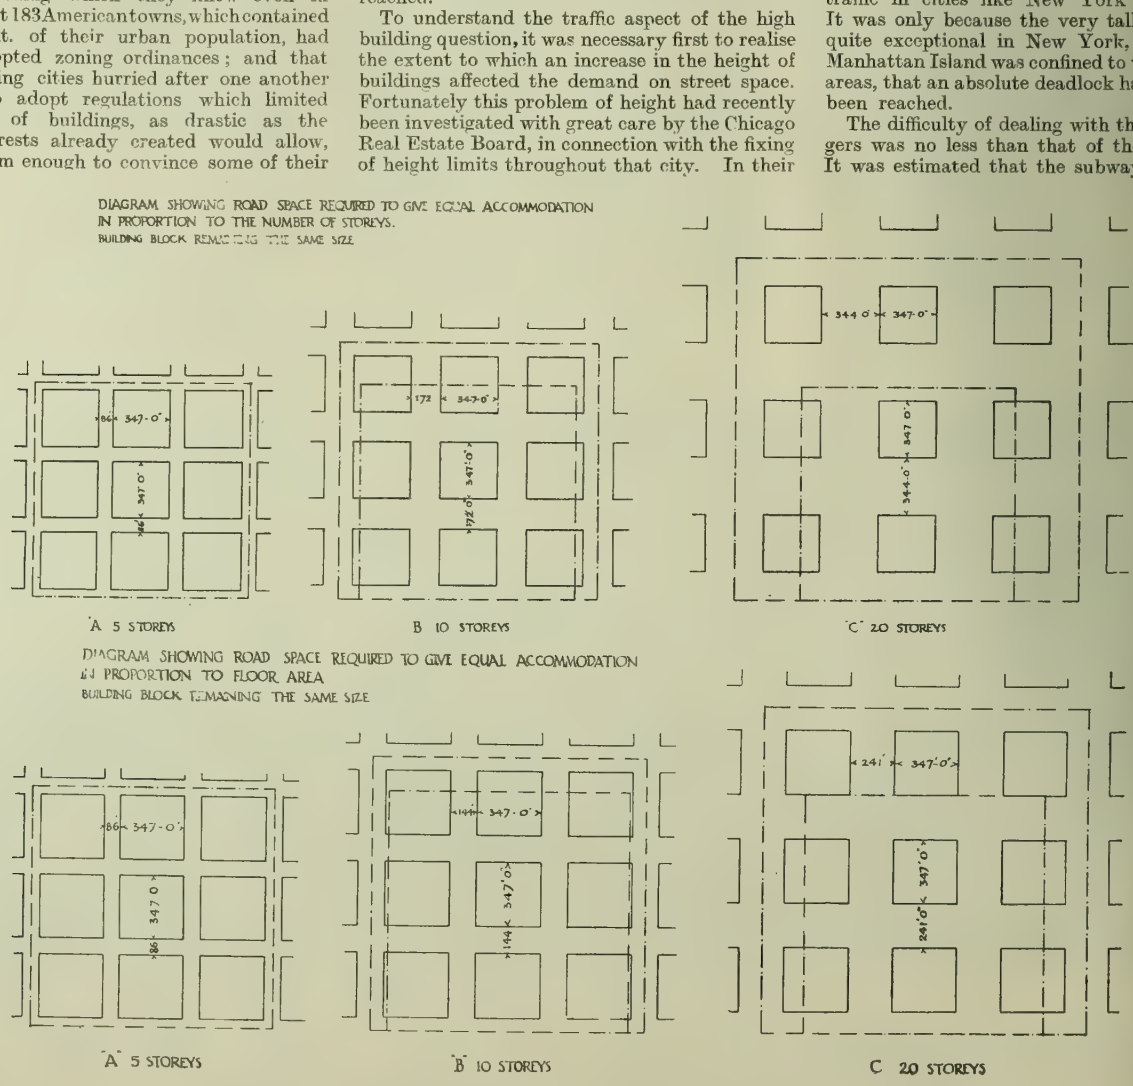
HIGHER BUILDING IN RELATION TO TOWN PLANNING.

MR. RAYMOND UNWIN, F.R.I.B.A., delivered a lecture on Monday, at the Hall of the Royal Society of Medicine, on this subject. The chair was taken by Mr. H. C. Gooch, Chairman of the London County Council.

The lecturer said twenty or thirty years ago in England it was generally assumed that great gains could be secured by over-crowding dwellings upon the land; and that some dire economic necessity arose from those reputed gains which compelled us so to develop our towns. That fallacy had now been pretty well exploded. Most of those who had examined the matter were agreed that, if people so willed, land could be developed at a density of ten or twelve houses to the acre, at little, if any, more, and sometimes at even less cost per house, than the same land could be developed for the same type of house, at a density of twenty or thirty to the acre; that so far from there being anything to be gained from overcrowding dwellings on land, the fact was such overcrowding yielded less total return to the landowners, and afforded a dearer plot for the occupant. So that apart from other disadvantages, congestion of dwellings was an expensive luxury. Unless they were careful modern business intelligence would not be content until it had had actual and disastrous demonstration that the vertical form of overcrowding had even less to be said for it than the horizontal kind. The fact that the method had been fairly well tested in America; that it had created there urban problems of a difficulty exceeding anything which they knew even in London; that 183 American towns, which contained 40 per cent. of their urban population, had already adopted zoning ordinances; and that the remaining cities hurried after one another pell-mell to adopt regulations which limited the height of buildings, as drastic as the vested interests already created would allow, did not seem enough to convince some of their urban theologians that many men could not stand on the same flagstone at the same time, nor more than one car move at one time on an identical piece of roadway. Nevertheless, in the hope that it was not too late to save London from copying mistakes which New York, Chicago, and other American cities now regretted, and the evil results of which they were now desperately struggling to remove, it seemed worth while to examine somewhat carefully the conditions which prevailed in those cities, and to realise what would be the effect in London if they now adopted the method of expansion upwards which the Americans were trying to discard.

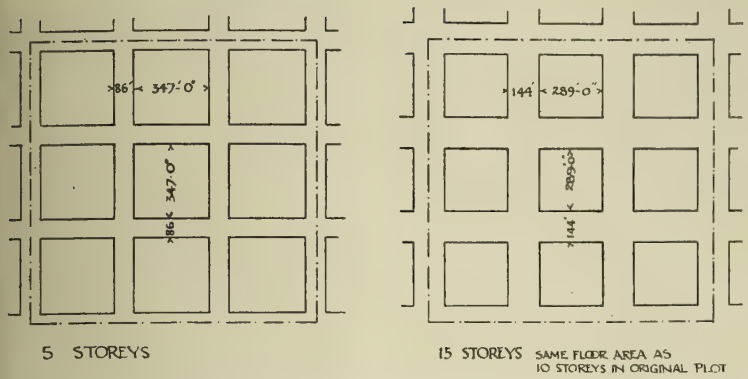
The arguments that could be brought against the adoption of high buildings were many and weighty. The law of diminishing returns applied to such buildings in almost all respects. With every added story the effective floor area per story was reduced, while the cost per square foot was increased; the greater proportional number of lifts required took their toll of space from each of an increasing number of floors. You did not dispense with transportation by going up; you merely changed the horizontally moving omnibus for the vertically travelling lift, and, incidentally, made walking for even short journeys far more difficult.

The more general, or town-planning aspect of the problem, had acquired a special degree of urgency for them during the last few years, because they appeared to be following another lead of their American cousins in regard to the extensive use of the private motor-car.



It was not yet apparent what would prove to be the saturation point in regard to ownership of motor-cars. Mr. Ford, who had contributed more than anyone else to the supply, did not consider that that point had been nearly reached.

To understand the traffic aspect of the high building question, it was necessary first to realise the extent to which an increase in the height of buildings affected the demand on street space. Fortunately this problem of height had recently been investigated with great care by the Chicago Real Estate Board, in connection with the fixing of height limits throughout that city. In their report they gave precise data for buildi ranging from five to twenty stories high, erec on one particular corner plot, including the rentable floor space, cost, and other matt There appeared to be a fairly constant relat between the net rentable floor space and total day population. He had checked it connection with one or two individual buildi like the Woolworth in New York, also in connection with the whole of the l area of Chicago, and he found that a figur about 45 square feet of rentable floor per h of population appeared to be near the m



As regarded carriage-way, it was safe assume in America that the class of people wh formed the day population in city buildi including as it did a minimum proportion children and others not owning cars, would any rate own the average number of one ca every ten people. If those cars were to att at the building to bring people to work, or t them away in the evening, and were packe closely as already indicated, they would fill whole of the carriage-way for a length of 1, feet with a five-story building, 2,220 feet w a ten-story building, 4,158 feet with a twe story building, and 5,616 feet, well ove mile, with a thirty-story building. If half carriage-way only were taken, on the grou that the other half of the street should be for the use of the buildings on the other s those lengths would have to be doubled. might reasonably be said, therefore, that w the present extent of ownership of motors America, the cars required twice as much len of roadway to accommodate them as the pe would require walking along the footways.

They would hardly be surprised, therefo that the utility of the private car was dimin ing, or wonder at the enormous congestion traffic in cities like New York and Chica It was only because the very tall building quite exceptional in New York, and even Manhattan Island was confined to very restric areas, that an absolute deadlock had not alre been reached.

The difficulty of dealing with the foot pass gers was no less than that of the road tra It was estimated that the subways could d

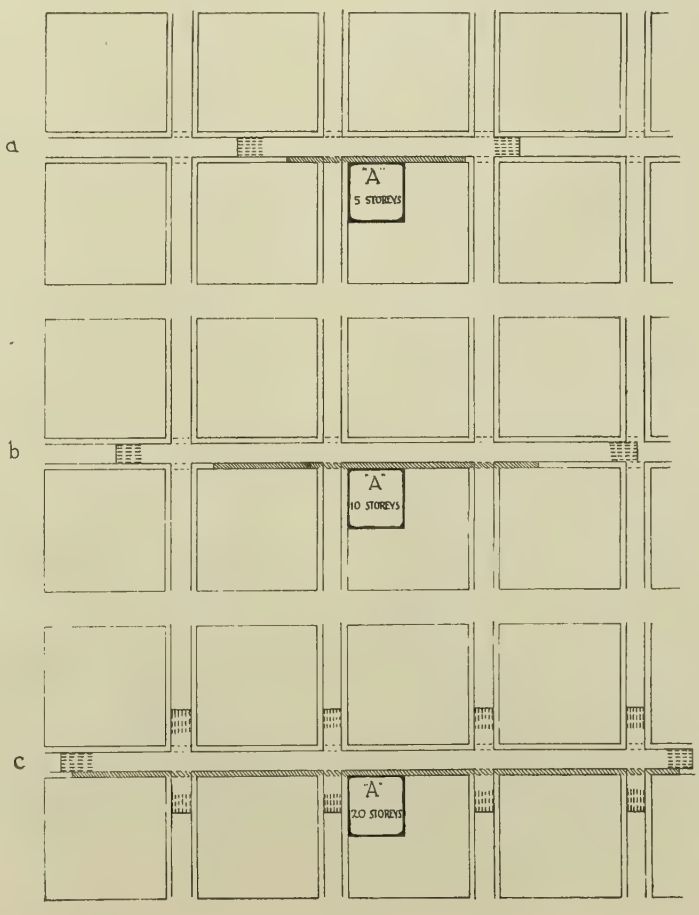
BUILDING BLOCKS OF THE SAME AVERAGE SIZE AS THOSE IN "THE LOOP," CHICAGO.

AGRAM SHOWING WITH SAME ROAD SYSTEM THE WIDENING OF ROAD AND CONSEQUENT DUCTION OF BUILDING BLOCK TO GIVE SAME ROAD ACCOMMODATION IN PROPORTION TO FLOOR AREA.

maximum, with 60,000 people per hour, hey could get that number to the trains. they had already seen that the 14,000 le from the Woolworth Building would nselves occupy over a mile and a quarter ne of New York's main footways, and it ld take them half an hour to enter the ion. The congestion at the entrances to tube stations, under these circumstances, d hardly be surprising, but this was not the st. The condition had been reached when as doubtful whether any relief could be red by constructing new tube railways. the difficulty of accommodating the pedes- n and the moving traffic were great, the of the standing motor-car was even worse. the 60,000 motor-cars which the present pants of the Loop owned among them, 3,500 could find places where standing was nitted within the Loop area. If the whole he road space were packed solid with cars, e would still be only standing room for 00 cars, or something like one-fifth of those ed. As a matter of fact, the car owners of Loop area had appropriated the large open e between Michigan-avenue and the Lake, aside for Grant Park, and it was no un- mon thing to see 25,000 motor cars, or more twice the number that would fill the streets ie Loop, parked at one time on this gigantic or garage. Indeed, the promoters of the t town-planning scheme designed by iel Burnham, of which the park was a picuous feature, were not free from anxiety o how they were to recover the area from motor owners, in order to lay it out and t it.

ithout pursuing the matter further, he ght that enough had been said to prove main contention which he had put forward— increase in height of buildings necessarily lved augmented street traffic; that where traffic had already reached the comfortable city of the streets, any further increase in ht must cause or increase congestion, with equent loss of time and efficiency for all users of the street. Further, that the ease could not in practice be met by street ening, because the utmost that could be in this direction could barely cope with other causes, which in all growing modern ns were tending to swell the volume of et traffic.

nfortunately he had come across no evidence the increasing use of the private motor-car ed a diminution in the patronage of public ns of conveyance. On the contrary, experi- showed that the demand for public trans- ation facilities was still rapidly growing. increased extent to which the streets of don were now being occupied by the motor ibus must be apparent to everybody, and lengthening queues of those 'buses which mulated on important road crossings idy presented a formidable appearance. as clear, therefore, that, quite apart from increase in the height or volume of buildings in the central area of London, they were y to have to face a steadily increasing volume of private and public transportation on the streets. It would tax all their powers to provide adequate road space to deal with the traffic, without permitting any increase in the height of buildings, with the consequent further congestion of people and business in the centre.



The advocates of high buildings suggested that their policy would at any rate reduce the general traffic problem. He found no evidence to support the contention, and much that tended the other way. If the concentration of people in high business and residential buildings tended to reduce traffic, a comparison of the traffic conditions in New York, with those in decentralised London, should give some indication of this. On the contrary, the number of journeys per head of the population in New York exceeded 500 per annum, considerably more than in London, where last year they numbered 390.

He ventured to suggest that, contrary to the view of the advocates of high buildings, it was approximately true to say that in regard to a large town, the nearer people lived to the centre, the greater was the demand which was made on the street and the various public transport conveniences, and the farther they lived from the centre, the less was that demand. Anyone who would consider the ways of his own family and those who served them would confirm this.

The real transport difficulty in connection with the residents in Southend and similar places was of quite a different nature. It was not so much a question of congested traffic in the centre, as one of the cost of providing adequate transport facilities at the two busy times, when folk were going to or from their work, in cases where the demand for transport during the remaining hours of the day fell far below the peak load. The problem was by no means insoluble. The chief difficulty sprang from the capital cost of the permanent way, which might have to be spread over a short daily use of the line. Apart from this fact, the running of a full train from start to finish of the journey was more economical than the condition of most suburban traffic, in which the load began to diminish at the first stop, and most of the trains had one-third or two-thirds of their seats empty for a considerable part of the journey. The rolling stock could easily be diverted to the lines where midday traffic was most intense. The capital cost of the permanent way itself would be immensely reduced if the routes were reserved in the regional town plan. Moreover, the means of transport were now so varied that one suitable to most kinds of load could be provided if there were effective co-operation between the town-planning and the transport authorities; while the efficiency of the transport itself could be increased, and the strain on the roads greatly reduced, if all the various means now available were co-ordinated under one general direction.

Some truths, the lecturer continued, seemed too obvious to be readily credited; men were prone to try clever and complicated devices to attain the same end by a more devious route. Perhaps the nation was feeling specifically poor,

DIAGRAM SHOWING AMOUNT OF STREET AREA REQUIRED WITH BUILDINGS OF DIFFERENT HEIGHTS TO ACCOMMODATE: THE AVERAGE NUMBER OF PEOPLE IN THE BUILDING "A" AND THE AVERAGE NUMBER OF CARS OWNED BY THEM.

but, to produce more wealth or to waste less seemed too simple methods of enrichment to be popular. Oppressed as they were, too, with the miseries of overcrowding and housing shortage, how hesitatingly did the simple remedy of building plenty of good houses secure full recognition. Similarly, the towns being already unbearably congested, and the traffic in their streets in danger of being reduced to crawling pace by its excessive volume, the idea that congestion would best be relieved if we desisted from crowding, or traffic most effectually reduced by better distribution of people and buildings, was much too simple to be readily accepted. Indeed, many seemed bent on piling more buildings on the top of those we had and boring more subways or erecting more elevated tracks to pour their additional multitudes into the already swollen torrent in the streets.

To the town planner this looked liked sheer madness; but perhaps there was something unusual in his make-up which predisposed him, with child-like innocence, to put more faith than some of his neighbours in the simple and the obvious. Or perchance, if an architect, there was something in his training or his practice which encouraged this tendency. At least, it was a fact that the art of design, which it should be the purpose of his training to develop, and his life work to practise, consisted largely in finding simple solutions for seemingly complex problems When the designer could not see the forest for the trees he was a lost soul! He must depend on his trained imagination to keep the forest as a whole ever clearly in his view while his mind was occupied threading its way through the obstructing trees and their distracting shadows. If he missed the one simple and direct path to unity, which when found would appear to all to have been quite obvious, he would usually have produced not a design at all, but a mere compilation.

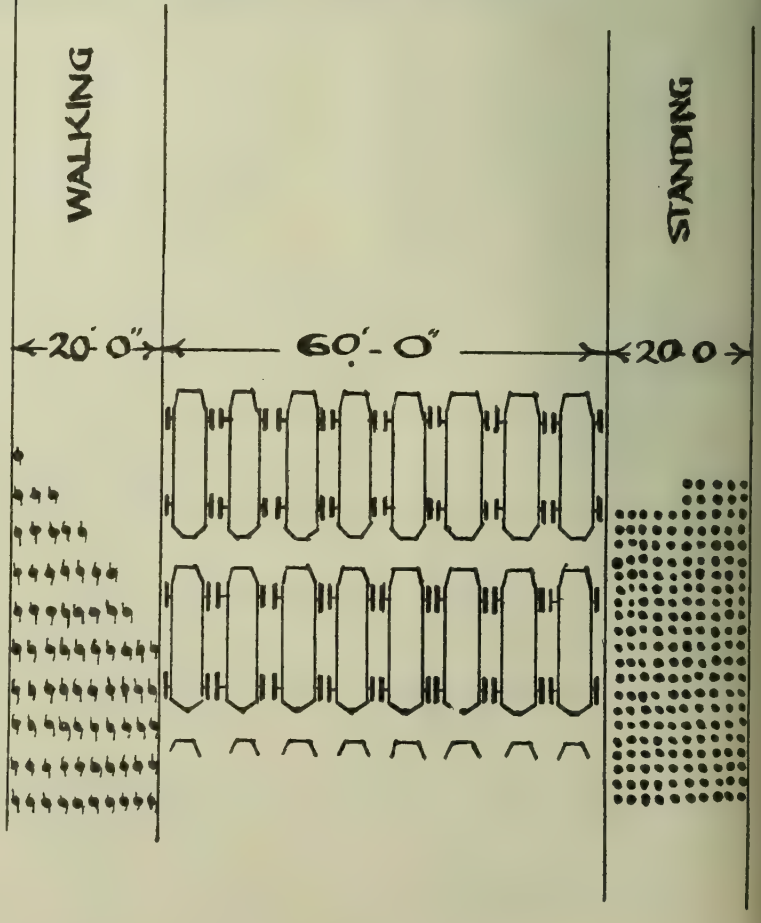
He had ventured to draw from American cities a warning as to some things which they should avoid, and to use their experience as a guide for their future steps. Beautiful as were many of the towers of New York when considered singly, there was yet lacking the sense of grouping between them which would spring from their forming parts of a greater design. Fine as individuals, they bore yet little relation or proportion to each other. He was inclined to compare a cluster of them with the three related towers of that older Lincoln which they prized.

However that might be, as architects they were trained to rely on orderly planning and proportional relation; and they naturally believed that they could be applied to towns; that the application of foresight and planning would result in the better distribution and relation of each other of industrial, commercial, and residential areas, and could secure the more generous reservation of belts of open space to protect and define the different parts of the town, the wards, the suburbs, the dormitories or the satellite towns; that cities should extend not by fortuitous accretions around the circumference, but by the addition of definitely planned and defined suburbs or satellite towns, each made as self-contained as possible, depending on the main centre for only those functions which were by their nature centralised; that the position of suitable rapid transit lines to connect these parts to the centre, and to each other, could be laid down and reserved, and that congestion of street traffic could be prevented not only by the provision of adequate roads, but mainly by the proper localisation of the life of each district, and the saving of a large part of the useless rushing about which now sprang from so many people, buildings, and parts of the town being in the wrong places. They were convinced that congestion would be cured, not by increasing the density of the crowd, but by transforming the crowd into an orderly queue. This at least was the alternative they offered to the policy of expansion upwards, being convinced that nothing could be gained by crowding.

Discussion.

Mr. H. C. Gooch moved a vote of thanks and said he agreed with every single word of the paper, which had been most convincing. They had to remember London was several hundreds of miles north of New York, and if it were possible to translate the conditions of America to England, the difficulties would be aggravated. Whatever might be said of the commercial value of high buildings, there was nothing to be said for them as habitations for the people. If they were doomed to live in buildings in which they could only get up and down in express lifts, there would be no opportunity for healthy exercise.

Mr. C. R. Forber seconded the vote of thanks, and said Mr. Unwin had given the devotees of high buildings a good deal to answer; a good deal to think about. He hoped that London would be spared from the evils that had inflicted New York.



Professor Adshead, F.R.I.B.A., said he came with the anticipation of hearing some new argument put forward. The question was almost a hardy annual; he felt, however, that the solution was near at hand. There was one point which he thought might be misinterpreted. The lecturer said if Central London were occupied by householders, we should have increased congestion; but if one took a map of London it was found that the old residential quarter had rapidly decreased in the centre, yet it did not mean that congestion had decreased.

Mr. Edward Warren, F.R.I.B.A., said it would be an appalling disaster if London were to admit buildings of even half the height of New York and Chicago. If London were deprived of sunshine our streets would be deplorable.

Professor Beresford Pite, F.R.I.B.A., said that a very important and interesting part of the subject could be dealt with from the æsthetic side. Whatever beauty was manifested in a high building was entirely taken away if they had another one next to it: only was sufficient to give dignity to the They could realise the effect if instead of Victoria Tower they had a hundred crow into a small space, similar, in fact, to conditions at Manhattan Island. The æsth aspect was ruined when they had contiguity

Sir Martin Conway, M.P., said he disag with many of the lecturer's conclusions. N had he experienced more comfort than whe lived somewhere about the fifteenth or twent story. In regard to the view from a building, it was incomparable: the most beau in the world. As regarded floor space he sidered that, instead of getting less, one got as one went higher. It had been suggested congestion in New York was the result of buildings. He, however, considered that buildings were the result of congestion, du increase of business. No one, he said, posed to put one high building against anot they must be widely spaced one from the ot Perhaps the main reason why he wanted buildings was to prevent London from encro ing on the country.

Mr. Delissa Joseph, F.R.I.B.A., said Mr. Unwin had referred throughout his a ments to higher buildings, and not to scrapers. No one suggested sky-scrapers neither were they likely to do so. Hi buildings had no connection with sate towns; but if commerce continued to gro must have office accommodation. That acc modation could be obtained by the mode raising of the height of buildings. If logically supported Mr. Unwin's theory were to curtail the development of sh banks, insurance offices, and general commer development, for the fear of a trouble traffic problem getting worse. It was a ma for traffic experts. Let them devote themse to the problem. They must not let the c mercial and industrial development of

ire suffer through curtailment of its s. If Mr. Unwin's forebodings were ded we should have to bring the forces of ion to a standstill.

nally, they must ask themselves the main ve behind the erection of a building. It one of profit not that of amenity or ctics. A man increased the height of his ises because he wished to increase his ess. He remembered some time back the man of the L.C.C. Fire Committee said that lings could not be higher than 80 ft., because was the limit to which water could be ed. At the time it had been remarked "it was grotesque that architecture ld be restricted by the height to which County Council could squirt water."

conclusion, the PRESIDENT moved a vote anks to the meeting, to which Mr. RAYMOND IN briefly responded.

e following are notes from the Minutes of Council meeting on December 3 :—

R.I.B.A. Examinations.

The Board of Architectural Education ts that two candidates had passed the mediate Examination in Sydney and one idate the Special Examination in Cape n.

The Overseas Final Examination qualifying or the Associateship will be discontinued January, 1924, and in its place the Intermate, Final and Special Examinations of R.I.B.A. will be held in the Dominions overby arrangement with the Allied Societies erned.

The following schedule of subjects has laid down for the examination in Professional Practice for students of recognised schools epted from the Final Examination :—

(1) Professional conduct; duties and bilities of client, architect, and builder; chitect as agent of client; architect as bitrator.

(2) Forms of contract and contract documents, including general clauses in specifications.

(3) Law of Easements; rights of landlord d tenant, including dilapidations.

(4) Building Acts and By-Laws.

e attention of candidates is drawn to the that the time allotted for the optional ct, C.3 (Design), will be increased at all e examinations from four hours to 6½ s, i.e., from 10 a.m. to 1.30 p.m., and p.m. to 5.30 p.m. instead of from 10 a.m. p.m. as previously.

e Provincial Conference of 1924 will be at Oxford in July.

der the provisions of By-law 12, Mr. d C. Bossom was elected a Fellow of the B.A.

der the provisions of By-law 24 a Licenwas censured and suspended for six months uoting fees lower than those prescribed by R.I.B.A. scale when applying for appointas architect to a public authority.

"DIANA OF THE EPHESIANS."

R BANISTER FLETCHER, in his lecture at the ral School of Arts and Crafts on Decem-5, traced the origin of the "Ionic Order" chitecture, as used by the Greeks, more ially in their colonies in Asia Minor. It was ter and more graceful than the sturdy an, and so it came about that the capital widened by the addition of the Ionic e above the echinus and the base was d to the fluted column to supply an appearof strength.

discussed the various suggestions, more or fanciful, as to the downward carving lute" or curl, which might be studied by loners at the British Museum to-day. Some ght its origin might be traced to Nature-s, such as the twist of the ram's horn, or of beautiful nautilus shell, which must have nded on the shores of Greece; others ght it was merely a developed form of the bracket capital of primitive timber architecture; while others, again, turned to the vegetable types of Egyptian capital as the prototypes of this curved form.

Amongst the many temples erected by the Greeks in this order were the two widely-different temples of Nikè Apteros, picturesquely perched on the Acropolis rock, dedicated to Athena in her character as patron goddess of naval enterprise, and that other gigantic building at Ephesus, erected to Artemis, better known as "Diana of the Ephesians." The site of this vast structure might still be traced, but the most striking record of this temple, with its services, its craftsmen, and its surroundings, was that dramatic description in the Acts of the Apostles which vividly portrayed the human interest of those days during the dawn of Christianity. The Erechtheion, a triple temple on the Acropolis, was another beautiful example of the Order, which had been much used down to modern times, and was thus another example of the immortal element which ever persisted in art.

MANCHESTER SOCIETY OF ARCHITECTS.

MR. PAUL OGDEN, speaking recently at the annual dinner of the Manchester Society of Architects, said he was weary of hearing people decry the architectural features of the city. Manchester had been told to remove the Albert Memorial. He would affirm that there was not a better memorial in the country, and it was the work of a Manchester man. A better theatre could not be found than the old Theatre Royal, nor a better art gallery than Barry's building in Mosley-street, and there were many other fine things if people only had the eyes to see and the intelligence to appreciate them.

In regard to the Ministry of Health, he said he was ready to admit that the Ministry had given them open spaces and the valuable Tudor Walters' report. But it had interfered with Manchester schemes in a manner which indicated that it did not know its mind, and he felt bound to say that Manchester could manage these things for itself much better than London.

THE LORD MAYOR (Alderman W. T. Jackson) said he agreed that devolution in such matters was desirable, but when the central authority provided a good deal of the money for building schemes interference of some degree was inevitable. On the general subject of architecture, he said that good architecture as a civic amenity had been somewhat neglected. Most big cities now had an architect's department, and the question arose: What was the legitimate sphere of activity of such a department? Personally, he thought it should be rather an administrative and advisory department than one to which people should look for creative genius. Some time ago, the Manchester City Council rejected the plans of an outside architect for a 'bus garage on the ground that there was a municipal architect who could furnish designs. That did not seem to him wise. It would have been just as reasonable to build an art gallery and then commission one artist to paint all the pictures for it. He was a strong believer in municipal enterprise, but for that very reason he would enlist the best brains in any profession to help any enterprise upon which the municipality was engaged. He did not see why good architecture should not be introduced to a greater extent in domestic buildings. He did not see why a workman's cottage should necessarily be ugly, but almost invariably it was.

MR. J. A. GOTCH (President of the Royal Institute of British Architects) said he had never heard a public man in the position of Lord Mayor make a speech so full of sound common sense on the subject of architecture as that which the Lord Mayor had delivered. He ventured to suggest that Manchester should follow the example of Birmingham and form a civic advisory committee to consider questions relating to the architectural amenities of the city and similar matters.

GOOD AND BAD MANNERS IN LONDON ARCHITECTURE.

AT the second General Meeting of the London Society, held on December 14, Mr. A. Trystan Edwards read a paper on this subject. Sir Charles Ruthen presided. The lecturer, in the course of his remarks, dealt with the nature of urbanity in architecture, and said urbanity was nothing more or less than good manners, and the lack of it bad manners. He contrasted a city of the old-fashioned type, in which public buildings dominated over shops, offices, and private dwellings, with a city in which the social hierarchy no longer obtained. He objected to sky-scrapers overtowering cathedrals and town halls, and to shops with domes and steeples, on the ground that such buildings showed a spirit of vulgar self-assertion which made impossible the dignified aspect of the city as a whole. Many British architects would like to erect sky-scrapers similar to the Tribune Tower, Chicago, but what chance would a Wren building have of asserting itself against such a heavy-weight? The Bush Building, which, when completed, would present a cupola comparable in size to the dome of St. Paul's Cathedral was, he said, a tendency to be deplored. It would eventually oust the dome of St. Paul's from its proud position of pre-eminence. When finished, the dome, from the riverside, would over-top Somerset House and be the most conspicuous thing in view.

The London squares of the Georgian era suggested that the occupants were more concerned to provide restful architectural effects than the tiresome expression of the idiosyncrasies of each separate householder. There was too much tit-bit architecture in those parts of London where the genius of our eighteenth-century forefathers established a great tradition of urban building. Urbanity in architecture consisted not only in the deference which one class of structure might owe to another, but in the deference it should pay to the street of which it formed a part. Another kind of bad manners in buildings, such as disregard for the public, was shown in carelessly designed backs of houses. The convention of blind windows was one of those white lies without which social intercourse was impossible; in fact, architectural good manners—not, perhaps, admirable in itself, but necessary for street buildings.

The lecturer also made reference to the "discourtesy" of many modern commercial buildings, which ignored the scale of the human figure and belittled the passer-by as if with direct intent to make him feel insignificant. Types of modern shops, familiar to Londoners, were contrasted unfavourably with the buildings of old Regent-street. In suffering Regent-street to be destroyed, we had lost the extreme example of good manners in architecture. In conclusion, he expressed the view that the cause of good manners in architecture was best served by a critical public opinion which, through agencies such as the London Society, could powerfully assert itself and ensure that the civic ideal would receive recognition.

In the discussion that followed, Mr. Raymond Unwin said Regent-street was on its way to destroy its value as a shopping centre, and customers were removing to another street. There was profound reality in the fact that, if architecture got too far away from the truth, it would come a cropper in the end. Truth was not inconsistent with good manners. They should learn and recover from the past the way in which architecture should be carried out.

The lecture was illustrated by slides, including views of the Quadrant in Regent-street, and the Harmonic Institution at the corner of Argyll-street.

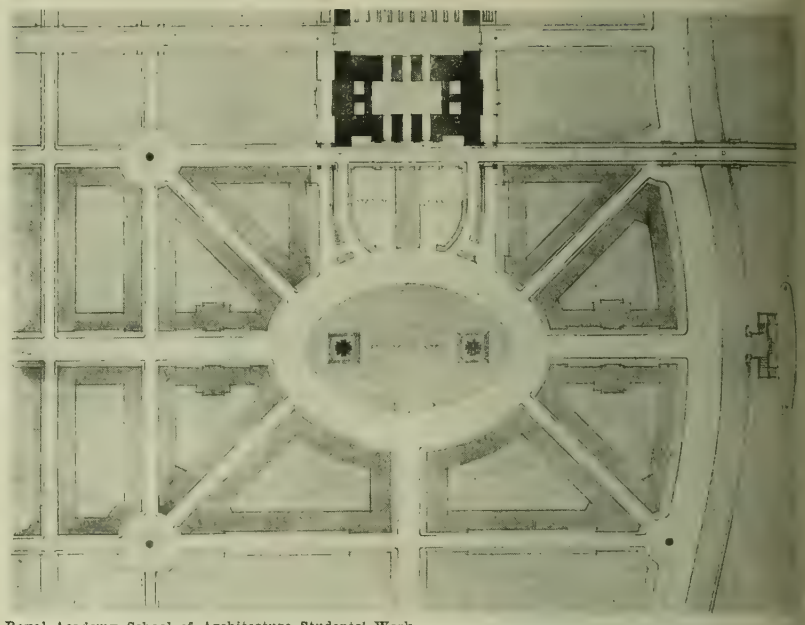
Royal Academy Students' Work.

A review of the drawings submitted for this year's Royal Academy Prizes and Studentships was given in our last issue; this week we illustrate a Design for a Railway Terminus, by Mr. J. C. G. Knight (R.A. Gold Medal and Edward Stott Travelling Studentship, £200); and Design for the Decoration of a Portion of a Public Building (Pottery), by Mr. T. D. England (First Landseer Prize (£30) and Silver Medal).

Swansea Masonic Temple Competition.

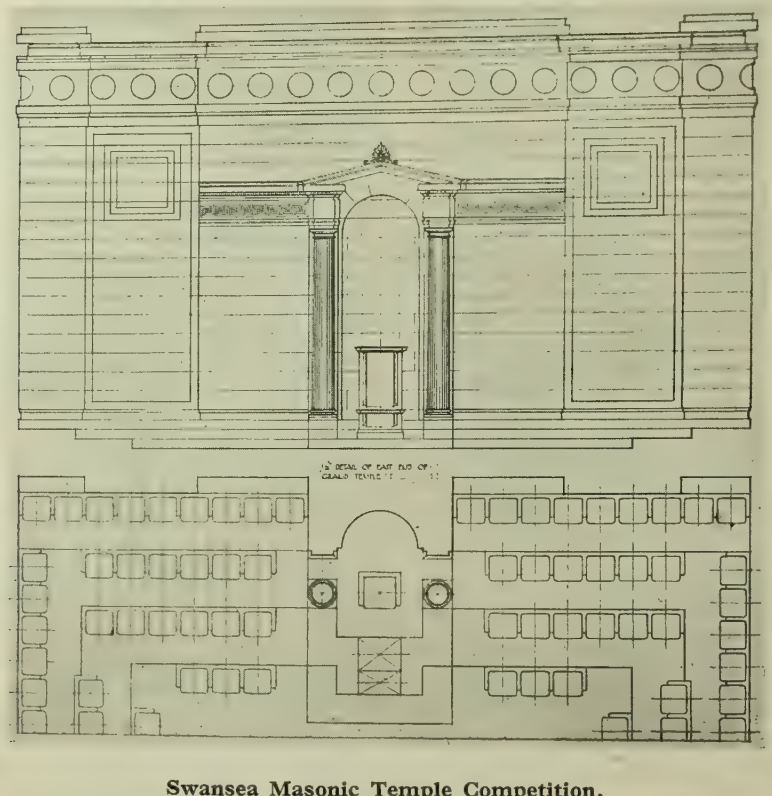
The design for Swansea Masonic Temple, by Messrs. Willmott & Smith, of Cardiff, was placed first in the recent competition. Mr. Arthur Keen, F.R.I.B.A., was the assessor.



Holy Trinity Church Hall, Hounslow.

The main entrance is from Bulstrode-road and faces south. A staircase leads to the larger hall on the first floor (58 ft. by 40 ft.), which seats 450 persons and could be used for dances as well as concerts, &c. At the farther end of this hall is a raised stage with retiring rooms, &c., for artists. An additional exit at this end is provided by a secondary staircase, giving access on to the Alexandra-road. This staircase is continued to the stage level for the use of the artists. There is a smaller hall (40 ft. by 28 ft.) on the ground floor at the northern end of the building, which is capable of sub-division by a movable partition. Lavatories for both sexes are placed in suitable positions for use in connection with both halls, and service is provided by means of a kitchen in close communication with the secondary staircase.

In addition, there are four large classrooms which can on occasion be alternatively used as cloakrooms. The building will be heated by means of hot-water radiators and pipes.



Considerations of economy have dictated a style of formal simplicity both in plan and elevation. Ornament has been avoided, a an attempt has been made to obtain archit tural effect by the inter-relation of the m features of the composition. The walls are be faced with picked London stock bricks, interior of the walls being of Fletton bri finished fair face and distempered. The ro will be supported by steel trusses 10 ft. ap and covered with double Roman tiles.

This design, by Mr. Cyril A. Farey, A.R.I.B. was selected by the assessor, Mr. Walter Tapp in the recent limited competition.

Royal Academy School of Architecture Students' Work.

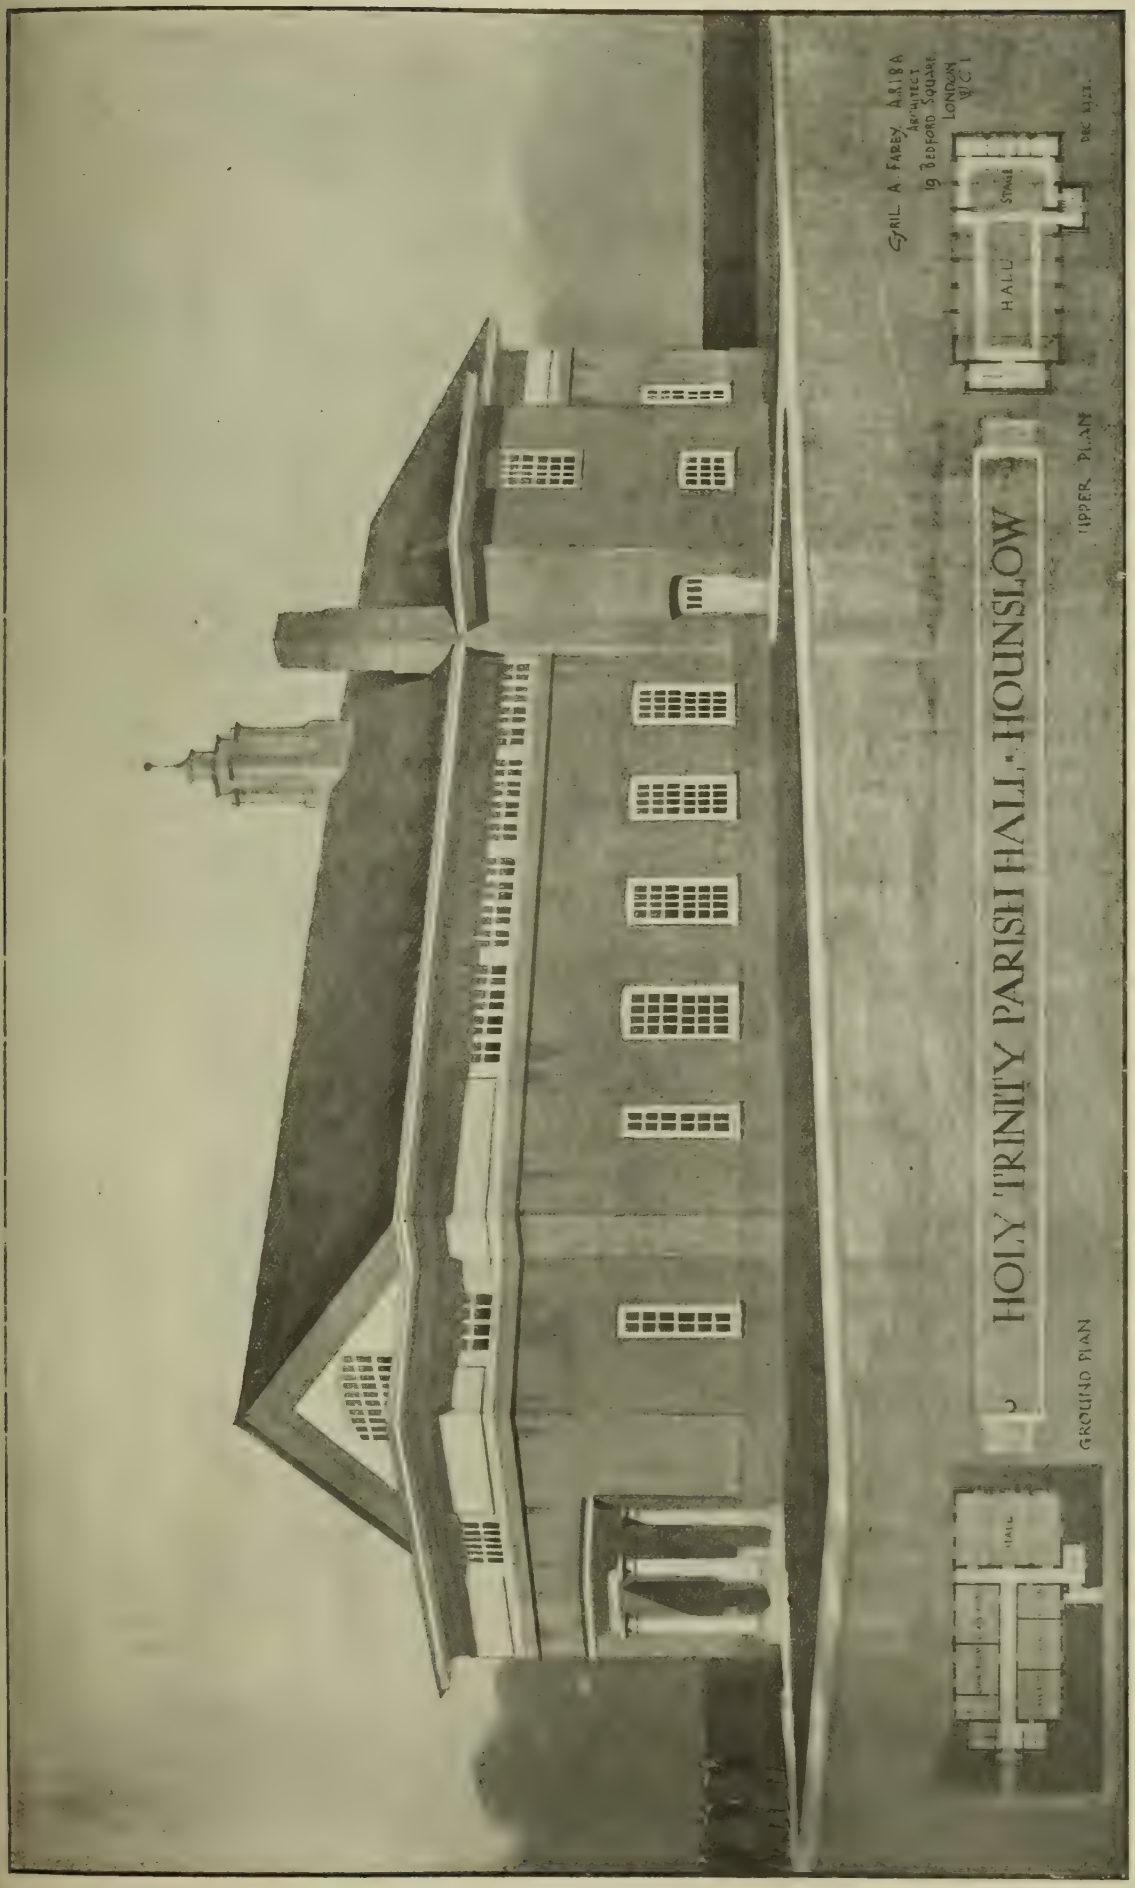
Design for a Railway Terminus. By MR. J. C. G. KNIGHT.
Awarded R.A. Gold Medal and Edward Stott Travelling Studentship (£200).

Swansea Masonic Temple Competition.
Design Placed First: By MESSRS. WILLMOTT & SMITH.

House at Nunthorpe, Berkshire.

This house is being built in the village Nunthorpe, some nine miles from Middlesbrou and occupies a site looking on to some of t most beautiful peaks in the Cleveland Hi All the principal living-rooms are arranged the south front with a view towards these hi the kitchen wing and garage, &c., occupy the north-east corner. The house is built local sand-faced bricks and hand-made sa faced roofing tiles.

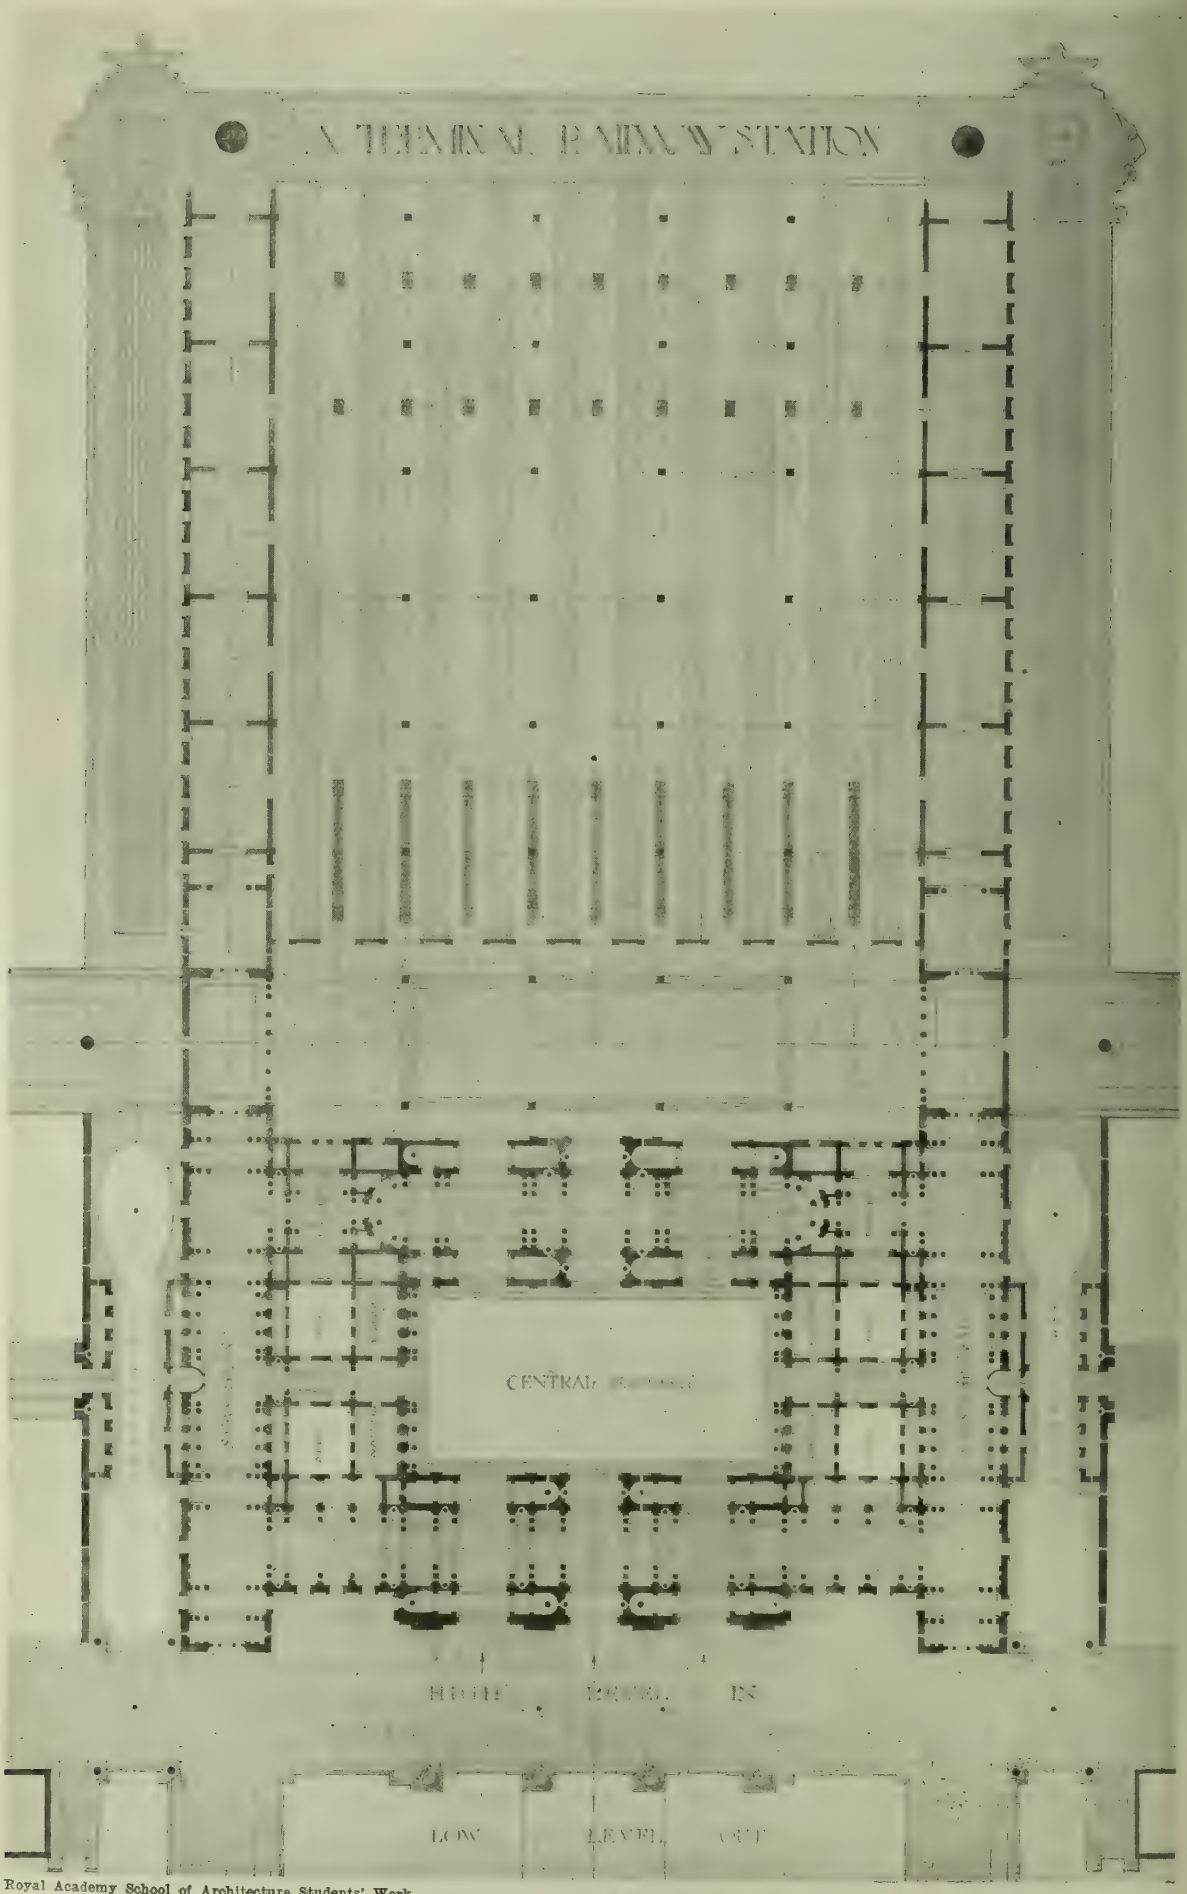
The feature of the plan is the hall-living-roo with the drawing-room and dining-room openi off it. All the domestic offices are screened a high wall, towards the garden front, which terminated by the garage roof, forming a go protection from the north-east winds. T main staircase and all floors to ground-flo living-rooms are in oak.



The house is being built by Messrs. Goodru & Tapster, of Middlesbrough. The bricks a supplied by the Eaglescliffe Brick Co., and t tiles are hand-made "Rosemary."

Messrs. Adshead & Ramsey, FF.R.I.B.A are the architects.

New Premises, Wimbledon.



The illustration on p. 961 is of a new drape establishment for Messrs. Elys, at Worple-roa Wimbledon. This is an extension of the present premises facing Hill-road, and unit thereto. The joint architects are Mr. Hamilton Simpson, F.R.I.B.A., and Mr. Hen W. Burns, F.S.I., and the quantities we prepared by Mr. A. J. H. Sprague, F.S.I.

The general contractors are Messrs. Roberts & Co., Ltd., of Kensington; met shop front by Messrs. Griffiths Bros., Chris church; floors by Messrs. Fram, Ltd.; centr heating by Messrs. Durbin & Katesmark artificial stonework by Messrs. F. Bradford Co.; steelwork by Messrs. H. Young & Co. metalwork by Messrs. Jas. Gibbons, Ltd. ornamental glazing and top-lights by Messr Luxfer; electric light wiring by Messrs. Misk & Rice; asphalte by Messrs. Thos. Faldo Co., Ltd.

MESSRS. GRAYSON & BARNISH, FF.R.I.B.A., AND MR. A. L. MCMILLAN, A.R.I.B.A., Joint Architects. (*See p.* 964.)

SOUTHPORT WAR MEMORIAL.

THE Southport War Memorial was unveiled on November 18 by the Earl of Derby. The joint architects are Messrs. Grayson & Barnish, FF.R.I.B.A., of Liverpool, and Mr. A. L. McMillan, A.R.I.B.A., of Southport, whose design was accepted in an open competition assessed by Sir Reginald Blomfield, R.A., in 1919. A connecting link between the obelisk and the gardens and the approach to the cenotaphs is formed by the open colonnades, which also emphasise the symmetrical lay-out of the square. The colonnades, formed with coupled Doric columns, have coffered ceilings. By the Ionic columns which mark the approach to the cenotaphs is a series of flags fixed to ebonised teak standards, and secured by bronze brackets. The apex of the obelisk is 67 ft. 6 in. above the flagging, the upper portion being 87⅞ diameters high.

EXHIBITION NOTES

OLD DRAWINGS AND PRINTS.

In the pleasant galleries of Messrs. Ellis & Smith, Grafton-street, is an extremely interesting exhibition of old drawings and prints of old London, which cannot have been got together without much careful effort. Notwithstanding the doubtful drawing and somewhat mechanical handling of many of the pictures, they have an undeniable charm. Sometimes the drawing of architecture by Rowlandson is so bad that one wonders how so able an artist could see it so badly, yet in his "Grand Improvements at Westminster" the figures and buildings are so intimately allied that a very charming drawing results and we forget to criticise the buildings. James Malton, Thomas Sandby, George Shepherd and Joseph Farrington made illustrations which remain of real value. Of these, Malton was the most remarkably sound and reliable—he would never have drawn the abutment columns on Waterloo Bridge with volutes as in the Farrington drawing. There is a fine aquatint of his "New Palace Yard" and the view of "Saint Paul's," of "St. Peter-le-Poor," and "Covent Garden" are amongst his best. The view of what Charing Cross was, as depicted by George Moore in his statue of Charles the First, shows how charming a picture it was compared with the dull mixture we see to-day, which only needed foresight and breadth of treatment to have become one of the finest civic centres in the world. To-day we have lost the old charm of the picturesque without obtaining the breadth and dignity which might have been some sort of compensation.

SWEDISH ARTS AND CRAFTS.

The Swedish Arts and Crafts Exhibition at the Grieves Gallery is worth seeing. A noticeable feature is the refinement of detail in the silver work, but in the fabrics there is much that seems crude and needlessly archaic. The pottery and glass are interesting, but we regret wood-carving was not included in the subjects.

"VICTORY." "MOURNING."

JEDBURGH ABBEY.—II.

By WILLIAM HARVEY.

The threading of the needles through the shattered walls of the tower demanded great caution, and a plan of operations was carefully made out before any stones were withdrawn. Although it was extremely desirable to avoid burdening the old piers, the state of the tower walls was such as to make it impracticable to cut needle holes until the surrounding masonry had been consolidated with cement grout. After the erection of the raking shores to the tower and centering to its arches, but before any needling could be commenced, the process of washing out joints and inserting cement was put in hand. The process involved a great deal of anxiety as the temporary timber supports could not be expected to relieve the fractured piers to any great degree, and the weight of cement required to fill the starved joints at this part of the masonry was considerable. The piers showed continual signs of movement under the altered conditions and added load. Tell-tales placed across the old cracks fractured again and again after being renewed, and demonstrated the precarious state of the ruined building. When the process of consolidation had proceeded as far as was deemed advisable in view of the conflicting requirements of the case, the holes for the needles were cut in successive small stages, with all the precautions used in tunnelling operations. The sides of the excavation were made good in hard Hailes stone set in cement as the work proceeded. The outer stones, which had perforce to be removed, were numbered in accordance with diagrams and photographs previously prepared, and were reserved for rebuilding in their proper positions after the needle should have been withdrawn again. The tops of the tunnels had to be made sound enough to communicate the support from the needles to the upper parts of the tower, and this was performed by inserting specially shaped steel plates as lintols from side to side of the opening with their ends bearing upon the Hailes stone linings at the sides of the tunnels. Each lintol was wedged up tightly to the underside of the old work before the next section of the tunnel was proceeded with, and the height of the tunnel was diminished as its length increased so that each succeeding lintol was placed at a rather lower level than that next to it. This device permitted of access to the irregular space between the lintol and the old work above for wedging and tamping in each case. When the tunnels were completed the rolled steel joists were slipped into position, and the space between their top phlanges and the undersides of the steel lintols was built up solid with wedges and small stones set in cement. This packing was rammed in so tightly as to produce a noticeable deflection in the needles since it was considered essential that they should actually carry the load before any operations could be started upon the piers below. Even with the needles in position and the piers relieved of the heaviest part of their load their condition was not such as to inspire confidence. Bulging and split, with the facing stones fractured and the internal rubble core in a powdered and disintegrated state, they had still to support the weight of their own masonry to the height of over 40 ft. above ground level. Some further work of consolidation was put in hand in the tower walls around the position of the needles to guarantee that the work should not break away piecemeal or settle unequally and affect the piers. It was also necessary to see how the gantry behaved under the load before attempting any work between the needles and the ground. These precautions were completely justified by the facts which were revealed in the process of the repairs. The cracks and movements which showed themselves on the wall face were but symptoms of more serious defects within, for, in addition to fractures and starved joints, large

Plan of North-West Pier: Sections 1 to 5 of New Reinforced Concrete Foundations were placed in Position before the Temporary Dead Shores were Removed.

[The photographs and drawings, except where otherwise stated, illustrating this article are published by permission of H.M. Office of Works.]

cavities were found in the centre of the wall, where old wall passages had been hidden in the course of fifteenth-century repairs without being filled in or having the earlier work properly bonded to the later.

Preparatory to actual recoring works a method of operations was devised, and the limits of each stage in the proceedings agreed upon. Special material was prepared to hand in the shape of screw jacks, steel bar lintols, steel and oak wedges, and short ends of steel rails, and it was made a principle of the operations that whatever was removed from the building should be immediately replaced by something stronger than itself. Each step in the proccedings was directed by this leading idea, and the several successive stages of the work were both thought out and carried out in such a manner as would tend to the prompt insertion of some suitable alternative support placed where it would not interfere unduly with future operations. If once a movement began while the piers were under treatment there was a very unpleasant probability that it would not stop until the material should have arranged itself in a heap on the ground. It was imperative that every action should be smartly executed, and only comparatively small portions of the work were undertaken at any one time. The number of skilled men who can be found for such work is necessarily limited, and space does not permit of hustling methods, nor can the mason in charge of the operations be made responsible for the supervision of too extended a field where so many details all vitally important to the safety of the monument, his own safety, and that of his men, demand his personal attention.

The first cut was made in the north-east pier early in February, 1915, when a small opening was made by the removal of a few facing stones, and the insertion of a pair of jacks and a steel lintol. The lintol was kept down sufficiently far from the top of the opening to admit of the insertion of steel bars between lintol and stone, and each stone was picked up on folding wedges supported by the steel lintol. The steel bars were used as ceiling joists to the cavity in process of excavation in the heart of the pier, and were pushed forward as the work of excavation advanced until they ultimately stretched right across the interior of the pier and were supported at their advanced ends upon the tail ends of stones composing the ashlar facing of its further side. Intermediate supports were put in from time to time as the nature of the work demanded, and the long bars were supplemented by short crossbars in places where the ceiling of rubble was particularly bad. How bad it was may be gathered from the fact that during the whole of the recoring operations it was never necessary to use a tool to dislodge the core which trickled out to meet the masons until at the end of th recoring work the masonry near the ste needles was reached where the repai already executed provided a sound roof f the first time.

The sectional area of the plan of the pi was divided into four quarters, and only on fourth was excavated at once. An entranc having been made, as already described, t direction of the excavation was slanted one side and the left-hand portion of the pi hollowed out completely for a height of abo 3 ft. until the cavity was bounded on thre sides by the tail ends of the ashlar facin stones and on the fourth side by the remai ing mass of rubble core and the small vest bule hole for access. While the roof of t excavation was upheld by the steel bars, jack and props which had been placed in positio as the core was removed, the interior wa carefully cleaned of dust, washed, and t tail ends of the ashlar facing stones coate with cement grout to ensure the adhesion the new concrete. Steel reinforcement ba ½ in. diameter were then placed in positio with hooked ends buried in small hole groped for them in the vertical face of th existing rubble core to provide for connectio to the adjoining mass of concrete when should come to be inserted. The concrete wa composed of Whinstone broken to pass a 1-in ring, 3 parts; clean gritty sand, 1¼ parts; an Portland cement, 1 part. In addition to th provision of reinforcement bars bond wa arranged between the blocks of concrete b forming a step or ledge in the rubble face

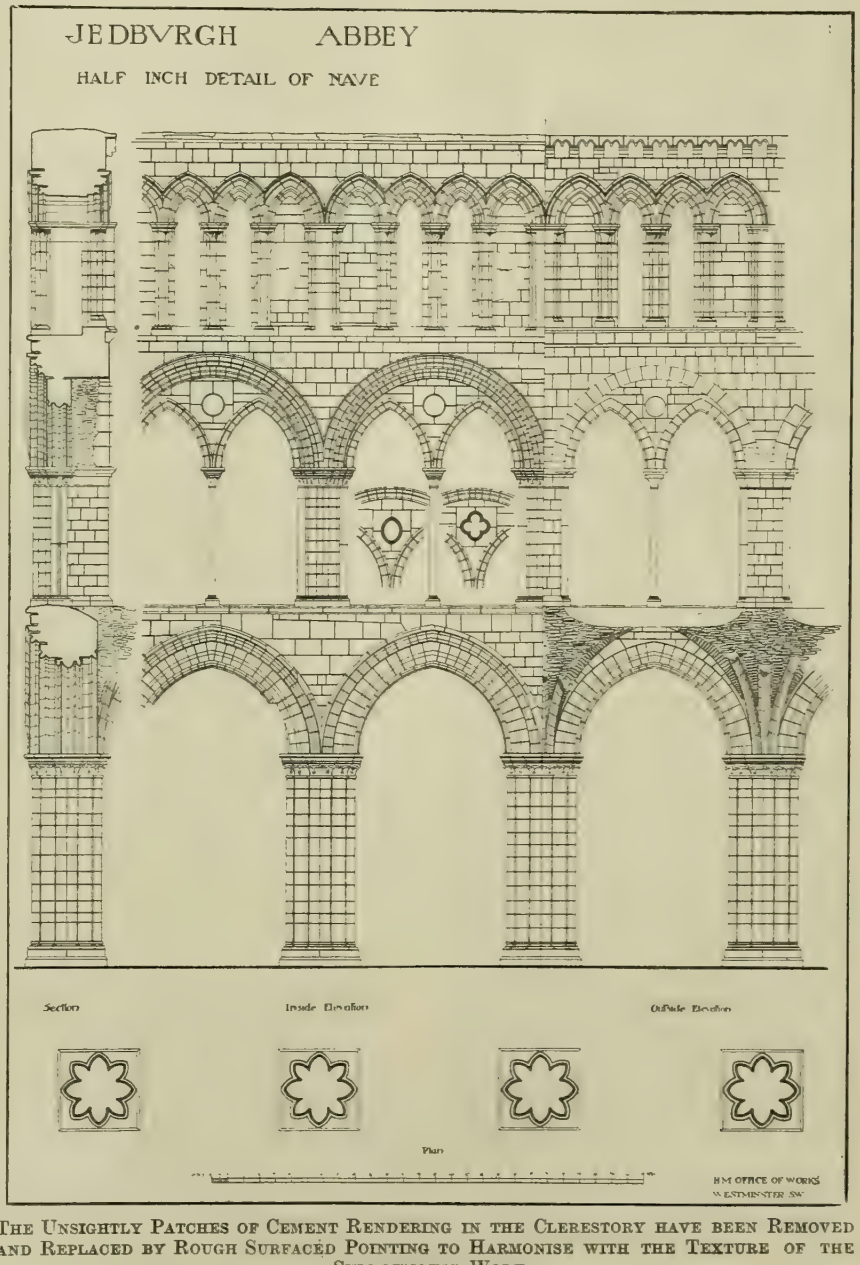
Jedburgh Abbey Church: Recoring of Piers of Tower

he core against which the concrete was deposited. To ascertain the degree of success hat had attended the process of consolidation specimen of concrete was cut out with a ragment from the back of one of the facing tones firmly embedded in and adhering to t. When the first mass of concrete had been uccessfully rammed home and allowed to arden a second portion of core was excavated n the other side of the pier, and when the oncrete had been deposited there the reaining central mass of core was removed nd the two great blocks of concrete incorporated together by means of a third mass eposited in the space between them. The ooked ends of the reinforcement bars came nto view again as the intervening mass of ubble core was removed, and connection was ade with other bars made with hook to hook. rogress was necessarily slow, as each conrete block had to set before adjoining parts ould be proceeded with. A slight delay occurred through the sinking of a boat which ruck a mine while bringing cement for the orks.



By the end of May, 1915, nearly four onths after the first cut had been made, he north-east pier had been recored up to the vel of the springing of the tower arches. he core here was found to be extremely oose and disintegrated, and the work was rried on upwards and outwards over the orth arch. As had been the case in the inerior of the pier, the ashlar was found to ave been split in all directions, and it was ecessary to insert copper cramps to save the agments of voussoirs that were in danger f falling away piecemeal. Steel reinforcement was used in the haunches of the arch o connect the masses of concrete, and some ther heavier sections of steel were inserted o take up part of the shearing stress which ad shown its dangerous effects in the fracured capitals and voussoirs near the springg of the arch. Throughout the work the shiar facing stones were found to have been rought only for a distance of 2 in. or 3 in. om the face, and to have been roughly essed to a pointed form where they tailed to the core. This " scamping " of the beds oubtless contributed to the bulging of the ers while the interior was formed of indifrent lime rubble; it is, perhaps, no defect ow that the piers are packed with excellent ment concrete since the space between stone nd stone allows the infilling to penetrate om the interior to within a few inches of e exterior face of the piers.

Work upon the north-west pier was comenced on May 8, 1915, and proceeded eadily until a year later the recoring had eached well out over the arch, and was conected up to the concrete already deposited the eastern half with a large keystone or rown block of concrete. This block had for s upper boundary the portion of the tower all that had been consolidated when the eel needles were inserted. On each side it as bounded by the masses of concrete, reacing the old disintegrated core, and beath it were the old Norman voussoirs, or ther the fragments of them which had rvived the racking movements in the arch. hey were retained in position with the help copper cramps, and still form part of the ructure although the core of reinforced conete is now so continuous as to form a comete weight-carrying frame. The two piers nd the arch above had now been thoroughly nsolidated and made practically monolithic ithout the removal of any large proportion the ancient facing stones. It must not e supposed that the whole of this delicate iece of work was performed without any xtraordinary precautions being taken. All d fractures were bridged with cement tellles, and the inspection and renewal of these, nd the examination of surrounding surfaces r possible new cracks, formed an important art of the work. The labour of keeping the mporary supports, wedges, screw jacks, rops, and bars in an efficient state of bearing during two years was colossal, and demanded vigilance both day and night. Undue force in tightening minor supports would have precipitated movements in the shattered structure, and to keep all supports equally tight demanded a routine of rounds which could neither be neglected nor relegated to any inexperienced workman.

The information as to movements in the structure afforded by the cement tell-tales and the opening of fractures was augmented by periodical readings of the levels of a series of copper dowels that had been inserted in the tower parapet at the commencement of the repairs, and also by reference to plummets at the corners of the tower. As the readings from these sources admitted of some uncertainty due to varying conditions of temperature, humidity and wind pressure, a special instrument for detecting minute movements was prepared at the National Physical Laboratory, Teddington. After experimenting with a magnifying lever arm, a telescopic apparatus was installed. The telescope was mounted upon a rigid support and was directed to sight through a lens fixed upon the north-west pier near its base to a graduated scale on the north transept wall. Readings of great precision were taken with this instrument, which permitted records to be kept of movements incapable of measurement by levelling or the use of the plummet.

A clerk of the works' report on July 21, 1917, describes the tell-tales and plummet wires as steady and no sign of movement in the tower. The telescope readings, however, lifted slightly on very hot days and returned to the centre of the scale on cool ones. The variations due to temperature were extremely slight, and from the moment the recoring was completed structural movement was practically brought to a stop with the summit of the tower just 1-16th in. lower than it had been shown by the preliminary survey.

The future preservation of the tower demanded that the underpinning should be put in hand. The weight of the two defective piers and of the north wall of the tower had been increased, by the addition of sound new material, to the extent of approximately 32 tons, and against the improved power of resistance thus obtained the fact had to be considered that some of the chief original causes of decay remained unchecked. Nothing had yet been done to spread the weight effectively upon the weak subsoil. The south winds would still tend to overturn the building, and the existing historical overhang of the wall to the north, which had been pre-

THE UNSIGHTLY PATCHES OF CEMENT RENDERING IN THE CLERESTORY HAVE BEEN REMOVED AND REPLACED BY ROUGH SURFACED POINTING TO HARMONISE WITH THE TEXTURE OF THE SURROUNDING WORK.

served with all other historical evidences, still exerted a damaging eccentric pressure upon the two northern piers, and would assuredly tend to make them grind their way deeper into the subsoil by imperceptible degrees with every vibration of the building just as had been the case before the repairs had been undertaken.

The underpinning operations were complicated by the presence of the temporary foundations for the pitch pine dead shores, which could not be removed until a large proportion of the underpinning was completed. These concrete blocks beneath the shores had been inserted when the shattered condition of the piers forbade any freedom of excavation near their bases, and for this reason it had been found impossible to arrange for their retention or include them as part of a future scheme of underpinning. To keep the pressure on the subsoil below three tons to the square foot a large lateral spread was necessary, and the combination of mass concrete with a grillage of reinforcement was adopted. The principle of executing the work in sections, which had been pursued successfully in the recoring of the piers was also adopted for the insertion of the new foundations. As each pit was formed for depositing the concrete the reinforcing rails were laid with their ends pushed forward into small holes groped for them in the earth on the sides where other sections of concrete would be cast in later stages of the work. Bond between the different blocks was assured by several lengths of rail inserted in this manner, and also by steps or toothings formed in the concrete to avoid straight vertical joints between one block and the next. Six-inch toothings were formed by the use of double waling pieces to strut the sides of the excavations and then depositing the concrete around them. The waling pieces were removed when the next adjoining section of excavating was put in hand. The interaction of design and the proposed method of execution, so essential in the treatment of ancient monuments, is clearly illustrated in these simple and sensible provisions.

As the underpinning neared its completion and the space occupied by the foundations of the dead shores was required for this purpose, means had to be taken to relieve and withdraw the steel needles. These had been forced to take a very great portion of the weight of the tower and were tightly fixed on the tops of the dead shores, with the steel folding wedges jammed and immovable beneath their seatings. It was desirable that the removal of the needles should be performed without shock of any kind, and also that after they had been relieved they should remain in position ready to be wedged up again in case of necessity if any settlement or fracture appeared in the building owing to the altered conditions of support as its weight was replaced upon the piers instead of upon the needles and dead shores. The operation was performed by sawing the dead shores through near their tops, the saws being followed up by thin-bladed steel wedges specially prepared for the purpose. The wedges were driven in such a manner that when the saws were withdrawn the wedges filled the sawkerf and supported the weight. The wedges were now gradually withdrawn again by means of a specially designed screw press, and the needles were lowered about 1-16th of an inch. The weight of the tower was now once more borne upon its Norman piers. Although the overhanging walls of the nave did not present the same difficulties as the tower or call for such radical treatment, their state was far from satisfactory since, while the bases of their piers stood in approximately straight lines, the wall tops as seen from the top of the tower were curved into gigantic bows with fractures at the centres of the curve, where their overhang reached its maximum, and at the points of junction with the masonry of the west gable and of the central tower. The difficulty of successfully treating these walls was very greatly increased by the piecemeal decay of the stone surface under the action of wind and damp, particularly in the soffit and walls of the clerestory passage. Certain repairs had already been executed here in recent years which were sound enough to be permitted to remain though the hard sharp edges and monotonous tooling of the new stonework contrast painfully with the weather-worn appearance of adjoining parts. Fortunately the walls are neither very high nor very heavy, and the piers, though slender, are comparatively well built and closely spaced. The pressures due to the overhanging wall tops are therefore not altogether out of proportion to the resistance afforded by the piers below. The walls were consolidated by washing out the dirt from cavities and defective joints and inserting cement, tamping and pointing. The overhang of the wall and the exclusion of water from the wall top were treated together. The loose dirty core in the wall top was removed and replaced by a long reinforced concrete beam hidden in the thickness of each wall. These beams are not designed to carry weight above their upper faces, but to act horizontally against the wind pressure from the south and against the overturning moment of the wall itself towards the north under the action of its own unbalanced overhang. Ample masses already existed in the masonry of the tower and of the west gable to form anchor holds or abutments at the ends of the long beams and the outward leaning west gable will be benefited by having the ends of the beams buried into its substance to prevent its further drift towards the west. Above the beam the wall top was neatly paved with York stone slabs with a sunk stone gutter and stone gargoyles to throw the water clear of the lower parts of the walls.

The Lady Chapel, which occupies the south choir aisle, retains its early vaulting, rising from massive cylindrical piers. The upper surface of the vault had already been protected by an asphalted flat roof at some former repair, and this has been allowed to remain in position, although when seen from above its dingy black colour is not altogether in harmony with the warm buff and purple grey of the old stonework. The underside of the vault had become covered with a sooty incrustation which adhered to the many coats of lime-white superimposed upon the surfaces of the ribs and panels. After ascertaining by experiment that no colour decoration remained to be affected, the dingy coat was carefully removed and the stone surface brought to light once more.

A paving of York stone was laid as a floor to this chapel to prevent the driving rain making a quagmire of the subsoil.

Excavations on the south side of the building revealed some foundation walls of claustral buildings which have been preserved in view; but the major part of the Abbey ground has been laid out as a garden, which makes a peaceful and pleasant setting to the ancient walls. The artistic value of such suitable surroundings is immense, particularly when blue, cream and white flowers happen to be showing in profusion.

Victoria and Albert Museum.

The Swiss Minister, Monsieur C. R. Paravicini, has lent to the Victoria and Albert Museum seven panels of early stained glass which are now exhibited on the stairway leading from Room 131 to Room 112 on the first floor. Three of the panels, originally in the Cathedral, Passau, belong to the Salzburg School and are dated 1494. The remainder are rare early Swiss work—two representing the Virgin and St. John the Evangelist, of either the Constance or the Zurich School of about 1430; and two are heraldic panels of the School of either Constance or St. Gall, dating from about 1440.

PRESERVATION OF ANCIENT MONUMENTS & HISTORIC BUILDING

SIR FRANK BAINES, C.V.O., lectured bef the Royal Society of Arts on December 12 this subject. Sir Aston Webb, K.C.V. C.B., P.R.A., presided.

The lecturer said he did not think it necessary, in view of his audience, to st a case which illustrated the value of prese ing their ancient monuments and histo buildings. They were a part of the cult and history of the British people, and he p posed to take it for granted that they were agreement as to the essential need of th retention and preservation. They were signal record of a previous social tra tion which brought down to our mechani and competitive age a suggestion of a sa spirit and finer method of life.

Before discussing the question in detail, would like to suggest first of all what th meant when they used the word "preser tion." Clearly they did not mean restorati or replacement of what was gone; they did mean renovation or renewal. The lat phrases were dangerous phrases—they w sometimes used by people entirely conservat in their sympathies, as though they were int changeable with the term "preservation." course they were not interchangeable, and was necessary to define the word "preser tion" as it meant a method which involv the retention of the building or monum in a sound static condition, without a material addition thereto or subtraction the from, so that it could be handed down futurity with all the evidences of its charac and age unimpaired. Restoration might a word which justifiably described a method preservation, but he wished to make it cl that that method was not the method he vocated.

The treatment of ancient monuments in past might be referred to under three he ings—the first, regrettably represented by word demolition; the second, by the word storation; and the third, by the word p servation.

The first phase clearly could be said to d from the dawn of history, and had be arrested in part only so late as the ea years of the nineteenth century.

Even when archæology was studied scien fically, Lord Elgin would seem to have h no compunction in removing the treasures Greece to this country, while as late as 18 Cleopatra's Needle was brought to this count and set up by the Thames. Naturally it cayed under the acid-laden atmosphere modern London.

In Germany, however, regulations for t preservation of its ancient monuments h been framed since 1815, and although th would not appear to have had statutory sar tion, much respect was shown for their mon ments. Indeed, Germany was richer at t present time in mediæval church furnitu than any other country of Europe. Englan in accordance with the democratic social ganisation, appeared to await the expressi of public opinion before committing itself statutory enactments, and it was not un 1822 that the first Bill which dealt with t subject became law.

In England, as in France, the lecturer sai the damage done owing to over-prodigality expenditure in preservation had been serio and irreparable. For example, to give o instance alone, the restoration of Worcest Cathedral between 1857 to 1874, which i volved an expenditure of considerably ov £100,000, resulted in handing down to us building that was externally to all intents ar purposes a modern structure. There was r record that major structural problems we involved, but a great deal of money w

ent on refacing, owing to the character of red sandstone of which the Cathedral was lt. During the first 50 years of Queen toria's reign, well over £1,000,000 was ent on 20 of our cathedrals, with results the judicious could only deplore; many these buildings were now largely modern, ticularly so in the cases of Worcester, ester and Lichfield. The east window Carlisle and the west window of York nster, probably the finest examples of wing tracery in this country, and perhaps the world, were lost to us; the whole ing been renewed in both cases. Need he again that replicas of ancient work, how-er perfectly and accurately executed, could ve no real historic or archæological value atever.

The lecturer said the first principle laid wn in regard to the problem of preservation s the need to ascertain as clearly as pos-le the static condition of the structure under its conditions of decay, incipient and par-l failure, actual collapse, etc., and he first all dealt with Tintern Abbey, which he id was one of their most interesting and antic Cistercian abbeys. The date of the isting work was generally that of the end the thirteenth century.

The original proposal, before the Department dertook the charge of the building, was to ke down and rebuild plumb, a great pro-rtion of the arcade above the arches. The partment, however, decided that such a urse of action would ruin the amenities of e building and, generally, the scheme which as undertaken was to relieve the eccentric ess on the north side of the piers, and also relieve them entirely of stress due to wind essure. This was done by the institution a great lattice girder of the N. type chored into the wall of the south transept d to the wall of the west gable, designed move under temperature stresses and under ght oscillation of the arcade. He wished make it clear that the scheme was devised preserve the amenities of the arcade as en from the nave, which otherwise would ve had to be heavily buttressed.

The lecturer then referred to Rievaulx bey, which he said was the earliest Cister-n House in the country, being founded in 31. Of the church, only the presbytery and e choir with the transepts and the east arch the crossing remained; and the nave, when was taken over by the Crown, presented a apled mound of ruins. The ruins had been ed as a quarry by the neighbourhood for ny years, and certain difficult structural blems were involved in their preservation. e method adopted to preserve the stability the arcade and the chancel was to remove e fractured stones one by one and to recore e whole of the spandrel and pier above with ong reinforced concrete. Afterwards the nes removed for the purpose of executing e work were replaced in their exact posi-ns. No single new facing stone had been ed, and even in the 12 months which had psed since the completion of the work no ce of what had been undertaken was servable.

The lecturer said that the problem of dburgh (recently dealt with in *The Builder*) s one of the greatest with which the De-rtment had had to deal.

It was believed that before the building was nded over to the control of the Government, suggestion had been made to take down the ver and rebuild it, at a very heavy cost. e methods followed by the Department, wever, could not contemplate this.

The actual cost of the work undertaken at dburgh by their methods, which were slow t inexpensive, was probably one-tenth (for e whole church) of what it would have st to take down and rebuild the tower ne. To-day the tower stood absolutely as was with no additions thereto, beyond the ernal reinforced core, which was now carry-g the load, with all the modern additions removed and the amenities of this fine build-ing were entirely preserved.

The lecturer said that Carnarvon Castle was probably the finest defensive castle in the country, and, indeed, in Europe: one of the great Edwardian defensive castles dating from 1285-1322. As the works of preservation, however, were mainly of normal character, he did not describe it in detail.

In regard to the method of preserving Whitby Abbey, the difference made in the building since it was taken over by the Government was very great, as it was suffering from destruction as a result of bombardment during the war, while the nave and the crossing were littered with fragments of the fallen church. The history of the Abbey was of extraordinary interest, as it was first founded upon the present site in A.D. 657, but the portion which remained was the twelfth-century church, which consisted of nave and choir, with aisles, transepts and, originally, a lofty tower at the intersection, all of which were encumbered with great masses of fallen masonry from the vaulting and superstructure which fell in the nave in 1762 and the great central tower which fell in 1830. Their recent excavations had revealed a large section of the plan of the Norman church, which would be shown in outline on the floor of the present church. The excavations to the north of the church now disclosed some very early buildings, which appeared to have been constructed in part of "wattle and daub." The excavations were far from complete at the moment, but it would appear that eventually a large portion of the Saxon, Norman, and twelfth-century buildings could be disclosed, the two former at least in plan. The problem in dealing with the west front was very difficult, as many of the stones were shattered into fragments, and the greatest difficulty was found in identifying them and replacing them in their true position. No moulded and wrot stones were put back unless they were original, and the whole of the work, after the work of preservation had been completed, was such that no intelligent observer could do other than perceive accurately what was original work and what was the later work of strengthening and repair.

In Kirby Muxloe they saw an example of a fortified manor house of Tudor times, which was commenced in 1480, apparently upon the site of an earlier moated house. It was of brick construction throughout, even to the turret staircases, with their complicated and enriched winding vaults, and was a remarkably fine example of first-rate brickwork of the period. The problem of preserving a brick building was entirely different from that of a stone building, particularly where the bricks were scaling and flaking through weather and age, and through the action of growth of all kinds. No attempt had been made, however, to re-face the scarred brickwork, but the flaking and decaying brickwork had been seized by a mastic cement and the original faces retained without any addition.

The lecturer next dealt with Bylands Abbey, which, he said, was in a serious state of neglect when it was handed over to the control of the Government. It was situated on the rich fertile plain at the foot of Combe Hill, in the North Riding, and there was little remaining above the ground level beyond stumps of walls heavily covered with ivy, all of which were in a state of complete disintegration and decay. There, again, the building appeared to have been used as a quarry for those requiring materials for building in the district. Buttresses were robbed, and the ashlar masonry removed in many instances as far as could be reached without scaffolding. It was difficult to exaggerate the appalling condition in which this building was found, and the regret they must feel was emphasised by the wonderful finds of enriched and carved work which they had made in excavating the church. The magnificent detail of much of the work of the building could hardly have been apprehended before its preservation was undertaken. Moulded caps and bases, corbels and carved springers, etc., had been found which, for their simplicity and beauty of design and astonishing assurance of execution, were difficult to rival. Quite a large area of fine vitrified tile paving had been exposed in the chancel which, although somewhat rough in manufacture, had special merit for its design and planning of colour scheme.

The next building, which illustrated the methods followed by the Government, was Goodrich Castle, the earlier history of which was not known. It was mentioned in 1204, while the small and very perfect Saxon keep clearly suggested that the work of the castle originated before the Norman Conquest, while the present remains, apart from the keep, would appear to date from Norman times until the reigns of Henry V and Henry VI. The problem was, he said, again grave, because of the consistent neglect of the building for well over 200 years. The stone used in the castle was a soft red sandstone, without any great strength, and this had weathered very badly, and the greatest care had to be exercised in dealing with the stonework, which was fractured and split apart in many cases by the roots of ivy and young trees growing upon the wall heads. Only a few weeks before the building was transferred under the Ancient Monuments Act a length of the north-west curtain wall, totalling a weight of 200 to 300 tons, fell into the moat, and left little or no evidence of the main cause of failure, but illustrated very definitely that the masonry had little strength in resistance to shear. They found that this castle was "slighted" by an order made by Parliament in 1647, and it was probably due to this order that the castle was in such an appallingly defective condition, although it was surprising that so much remained standing nearly 300 years after the order was made.

The lecture was illustrated by slides and views of the following buildings and structures:—Netley Abbey, Hampton Court Palace, Westminster Hall, Richmond Castle, Huntingtower, Stonehenge, Maes Howe, Mousa Brock, Maiden Castle, Dorchester; and the lecturer explained briefly the character of the works of preservation undertaken in each instance, and illustrated how the scheme of preservation was strictly relative in every instance to the peculiar character of the work which remained.

Law of Property Act, 1922.

Mr. A. F. Topham, K.C., gave his third and last lecture on this subject at the College of Estate Management on December 1. In this lecture Mr. Topham dealt with the changes in intestate succession under the new Act, and showed the various ways in which the law of succession had been simplified. He pointed out that these entailed no real hardship on anybody because if the rules of intestate succession were not liked it was only necessary for the person to make a will in order to avoid them. The new Act also simplified matters very much by doing away with the various rules which in the past had been connected with the various kinds of tenure. The lecturer then dealt with the subject of compulsory registration of title and the arrangements for its possible extension to the Provinces in years to come. He also pointed out the improvements which were made in the Act of 1922 in the working of the Register. The various extensions and amendment of the Settled Land Act under the new Act were then considered and explained. In conclusion he pointed out that he had had to omit very many important points in the new Act, but the features he had dealt with were the outstanding ones which were of the greatest importance to those dealing with estate and to those who make the greatest change to the general public.

THE POETRY OF ARCHITECTURE.*

THE claims of architecture are so important in the attainment of the higher standards of living now considered necessary for the people, that we welcome the growing interest which is evident around us. A wide field of operation is opened to all who are engaged in the building crafts, but without general esteem and popular appreciation to replace the patronage of the past there can be no stable foundation upon which to develop the art. It is with pleasure, therefore, that we observe the inclusion in the People's Library of a volume upon the "Poetry of Architecture," by Mr. Frank Rutter.*

Both in the title of his book and by the significant headings of the chapters, our thoughts are directed to architecture in its more emotional sense. The author writes of the ages—of Fear, of Grace, of Strength, of Piety, of Aspiration, of Elegance, and, last of all, of Memory. He is not unconscious of the fact that these fluctuating and variable emotions existed at every age—we might add that most of them occur not only in humanity but in the animal kingdom. The author believes in the predominance of one or other of these emotions as distinguishing traits upon the physiognomy of buildings, and as visibly impressed upon the canonic styles. Architects are too deeply preoccupied with the systems of construction and the synthetic development of design to set much value upon these psychological impressions, but the unfailing attraction they possess for others must be recognised.

From the professional point of view the book may be regarded as the work of an amateur of taste and intelligence, whose intuitions, predilections or prejudices, are not always sound; but it is clear that he enjoys architecture and appreciates it in many of its manifestations. Some parts of this book bristle with what we regard as erroneous views founded on misinformation and misunderstanding, but this will not disturb many who would hesitate to approach our professional literature. The art of simple and natural description, which seems to come so happily to his pen, does not generally come so easily to those engaged in finding expression in another medium.

Architecture is one of the most wonderful of human achievements. In every style and at every age its transcendental qualities are visible, and although æsthetic expression may at times seem feeble and inadequate, when we have probed a little deeper we generally see, preserved those fundamental and universal principles which underly all the arts. Architecture proceeds upon rational and continuous principles, however miraculous and wonderful the structure may appear: it is the outcome of particular circumstances resulting from methods responding to the knowledge of the times. Such fearful solemnity as impressed Egyptian architecture accrues from the heavy terraced roofs employed in that early stage of civilisation, and from the heavy columns which were required to support such a load. The grace of Greek and Greco-Roman buildings was made possible by the introduction, at a later date, of the tiled or gabled roof. The strength and grandeur of the architecture of Imperial Rome, with the magnificently ordered plans, marks the development of the Arch and its congener the Vault. The daring developments in arcuated building ultimately attained in the aspiring churches of the Middle Ages follow a gradual constructive development. Such amazing structures only the gods could have foreseen, with imaginations in full flight.

A further accumulation of knowledge, with new-found individual liberty, accompanied by profound study of the monuments of antiquity, inspired the Renaissance. The scholarly impressiveness of St. Paul's Cathedral, the North Pavilion of the Louvre, the Theatre of S. Carlo, Naples, and such spirited and imaginative frontispieces as that of the Cathedral at Granada are the culmination of all that had then been attained in architecture.

The memory of these undying glories fills our minds with ardour, and what has been done encourages us to continue in the same spirit the same undying traditions to the attainment of a still greater future.

* "The Poetry of Architecture." By Frank Rutter. (London: Hodder & Stoughton.) Price 2s. 6d. net.

PRESENTATION TO AN ARCHITECT.

ON December 12, at the Savoy Hotel, a complimentary dinner was given to Mr. F. C. Bayliss, F.S.A., followed by a presentation of silver plate. The chair was taken by Mr. C. T. Marshall, L.R.I.B.A. The following guests were present:—Mr. F. C. Bayliss, F.S.A.; Sir Charles T. Ruthen, F.R.I.B.A.; Mr. W. H. D. Acland; Mr. M. St. J. Hornby; Mr. W. Tweedy, F.S.A.; Mr. F. Bayliss, jun.; Mr. G. S. Packer, M.S.A.; Mr. G. Pemberton, L.R.I.B.A.; Mr. P. B. Rigg, M.S.A.; Mr. B. C. Andrews, M.S.A.; Mr. G. L. W. Blount, M.R.I.A.I.; Mr. A. H. Lister, M.S.A.; Mr. H. T. Bill, A.R.I.B.A.; Mr. L. F. Thurgood, C.S., and Mr. G. Overall.

SIR CHARLES RUTHEN proposed the guests, and MAJOR ACLAND responded.

MR. G. S. PACKER said he regretted the President and Secretary of the R.I.B.A. and the S.O.A., respectively, were unable to be present. He mentioned he first met Mr. Bayliss when he was the architect for a warehouse in connection with a large shop in the North.

MR. C. T. MARSHALL said it had seldom been the lot of any man in the architectural profession to preside over a similar function to that which he had the pleasure of presiding over that night.

Mr. F. C. BAYLISS, in reply, said it was very interesting, when one looked back, to see the close association between the smiths and the architects in monasteries of long ago. To their encouragement of the arts they owed much of their present prosperity. Ruskin said there were four standards of architectural admiration: sentiment, pride of possession, workmanship, and the artistic. The question whether the thing admired was wholly admirable depended entirely on a matter of proportion—did it serve its proper purpose? That was the standard they had to judge by to-day.

One of Edgar's laws read: "We command every priest to increase knowledge, diligently learn some handicraft." That law had far-reaching effect on their development, although it was made by a comparatively young man about the year 975; and they all realised to-day that the fostering of the arts and crafts was a vital thing in the country's welfare.

Ruskin further said of the architect that he was one who could appreciate all the beautiful things of the world, and brought them into proper use, rather than a mere builder of stone and iron. As architects they had a very high mission if they liked to grasp the opportunities before them. If they looked round they could see that a new order of architecture was springing up, which might appropriately be called "the commercial order." It was having a great influence on the style of architecture in all their great cities and towns. It was rather interesting to note how their first shops came into being in England. It seemed a remote illustration, but was, notwithstanding, a true one, however quaint. The feast days of the priests became the fair days; they gradually led to the "forestaller," whom Henry III regarded as an oppressor, and an edict was brought out against him and his little stall in the road, which eventually led to the front room of the houses being turned into shops for the display of goods.

If they carried their minds back 20 years they could easily visualise the wonderful progress which had been made in the streets of their principal cities. One had only to think of Regent-street and the colossal changes which were taking place, of the great difference between the ideas which were forcing their way into prominence in the development of those buildings, and what was attempted in the first block near Piccadilly-circus, to realise the truth of the assertion that there was no shop architecture springing up which took into account the vital needs of the business which they had to house. Kingsway was another example. He remembered being one of the first to go down Kingsway when it opened and when one looked at it to-day it seemed very difficult to imagine the quietness of its early days. Many more examples could be given but those given served to show the great future which laid before them in this respect and the need for a department of architecture which took into account the business requirements of their streets.

MUNICIPAL RECREATION.

THE eighth of the series of lectures on Town Planning, given by Mr. William Haywood, F.R.I.B.A., at Birmingham University, was entitled "Municipal Recreation," in the course of which the lecturer said that an important auxiliary to health in great cities was the provision of an adequate amount of open space; and where this could be arranged in association with closely built areas, it was at its greatest value, whether for the general purpose of ventilation or as an aid to amenity.

The absence of spacious accommodation for promenading in industrial towns led to the use of main roads for this purpose—a purpose which they were never intended to serve; and which cities like Vienna, with great belts of parkway near to the centre of the town, could absorb with advantage to all concerned.

Suburban parks, which were once used almost exclusively for promenading, were now greatly encroached upon in order to accommodate casual or organised ball games, the increasing demand for which continued to embarrass the park administration of our great towns. This was particularly true of Birmingham, where notwithstanding the provision of special sports fields by large industrialists for the use of their employees, and the generous efforts of the municipal authority and of private benefactors to extend the present accommodation the need was still very great.

It was clear that park administration in this country was tending towards wider and more significant responsibilities; and that in common with other European countries we should reconsider the whole question of municipal recreation on a basis similar to that adopted in America, where great nature reservations outside the city were linked up with suburban parks, by means of parkways and strays, which cut right across the heart of the town, and so brought space and amenity to those who needed it most. This framework was supplemented by neighbourhood centres, which were provided at suitable intervals, for those whose duties or temperament kept them near to their homes, and by smaller grounds where children could play in safety with apparatus specially designed for their use.

Such schemes for recreative facilities were designed as an integral part of the town plan, and were adjusted to the needs of all classes of the population. Their cost was usually met by a "betterment levy," *i.e.*, a method of assessment on property which had been improved in value by association with new parks and boulevards.

Messrs. G. Bell & Sons, Ltd., inform us that early in the New Year they are publishing an illustrated volume on the ancient architecture of Western Asia. It will deal with Chaldæan, Hittite, Assyrian, and Persian architecture.

THE BUILDING TRADE.

ESTIMATING FOR SMALL BUILDERS.—X.

By J. H. BARNS, F.I.O.B.

PIPE WORK.

THE following is from the Standard List of Prices for wrought welded tubes and fittings :—

Nominal internal diameter, in inches.	¼ in.	⅜ in.	½ in.	¾ in.	1 in.	1¼ in.	1½ in.	2 in.
Tubes 2 ft. long and over ..... per ft.	4d.	4½d.	5½d.	6¾d.	9½d.	1/1	1/4½	1/10
Pieces 12 to 23½ in. long ..... each	10d.	11d.	1/1	1/5	1/11	2/8	3/4	4/9
Do., 4 to 11½ in. long..... „	7d.	8d.	9d.	11d.	1/3	1/8	2/2	3/–
Long screws, 12 to 23½ in. long.. „	11d.	1/–	1/3	1/7	2/2	2/10	3/9	5/3
Do., 3 to 11½ in. long..... „	8d.	9d.	10d.	1/1	1/5	1/11	2/6	3/6
Bends ..... „	8d.	9d.	11d.	1/2	1/7½	2/7½	3/2	5/2
Springs, not socketed ..... „	5d.	6d.	7d.	9d.	1/1½	1/11½	2/3½	3/11
Elbows, square ..... „	10d.	11d.	1/1	1/3	1/6	2/2	2/7	4/3
Tees ..... „	1/–	1/1	1/3	1/7	1/10	2/6	3/1	5/1
Backnuts ..... „	2d.	2d.	3d.	3½d.	5d.	6d.	8d.	1/1

Random lengths of wrought iron tubes over 12 ft. screwed and socketed are charged at list prices. In the case of tubes being supplied otherwise than in long random lengths the increase would be as follows :—

Random lengths over 12 ft. screwed at ends, but without being fitted with sockets, less 2½ per cent. on the nett.

Random lengths over 6 ft. and up to 12 ft. inclusive, screwed and socketed, plus 5 per cent. on the nett.

Random or exact lengths 2 ft. to 6 ft. inclusive screwed and socketed, plus 12½ per cent. on the nett.

Tubes are cut to exact lengths if so desired, and charged at 2½ per cent. less gross discount.

DISCOUNTS.

Black gas tube and fittings	52½	per cent. discount
Blue water do.	47½	„ „
Red steam do.	42	„ „
Galvanised gas tubes ..	37½	„ „
Do. do. fittings ..	42½	„ „
Do. water tubes	31¼	„ „
Do. do. fittings ..	37½	„ „
Do. steam tubes ..	25	„ „
Do. do. fittings ..	32½	„ „

It will be seen from this list that wrought iron tubes, 2 ft. long and over, are charged at the Standard List price, less the discounts, which vary from time to time.

Pieces less than 2 ft. are sold at each.

Long screws are pieces of wrought iron tube with a longer thread than usual, and are used to form a connector. The connector, therefore, consists of a long screw and a backnut ; the backnut is necessary, otherwise the joint is apt to leak owing to the thread of the long screwed tube being cut slightly deeper.

Bends are supplied to several angles. When supplied to a right angle they are termed "Bends" ; when to some more obtuse angle they are termed "Springs." The seeming difference in price is due to the springs not being quoted with sockets.

Nowadays a large amount of pipe work is done by entirely eliminating the screwed ends and sockets to the barrel, and doing the whole work with plain barrel and making bends and connections of the pipe by acetylene welding methods, and it is considered in the case of pipes 2 in. diameter and upwards to be much cheaper.

One of the advantages claimed for this method is that in the event of a pipe leaking it would only be necessary to use an acetylene blow pipe to remedy the defect.

In estimating for tube work it is necessary to measure the actual running length of the pipes, and the number of the fittings such as tees, elbows, bends, &c., required.

ELBOWS (SQUARE).

Internal diameter.	¼ in.	⅜ in.	½ in.	¾ in.	1 in.	1¼ in.	1½ in.	2 in.
List price	10d.	11d.	1/1	1/3	1/6	2/2	2/7	4/3
Discount, 42½ per cent.	4d.	4½d.	5½d.	6½d.	8d.	10½d.	1/1½	1/9
Nett	1/2	1/3½	1/6½	1/9½	2/2	3/0½	3/8½	6/–
Labour fixing would cost about 25 per cent. of gross cost of fitting, say....	2½d.	2½d.	3½d.	4d.	4½d.	6½d.	8d.	1/1
	1/4½	1/6	1/10	2/1½	2/6½	3/7	4/4½	7/1

BENDS.

Gross List price	8d.	9d.	11d.	1/2	1/7½	2/7½	3/2	5/2
Discount, 42 per cent.....	3½d.	4d.	5d.	6d.	8d.	1/1½	1/4	2/2½
Nett price	11½d.	1/1	1/4	1/8	2/3½	3/9	4/6	7/4½
Labour fixing would cost about 25 per cent. of the gross cost of fitting, say..	2d.	2½d.	3d.	3½d.	5d.	8d.	9½d.	1/3½
	1/1½	1/3½	1/7	1/11½	2/8½	4/5	5/3½	8/8

TEES.

Gross List price	1/–	1/1	1/3	1/7	1/10	2/6	3/1	5/1
Discount, 42 per cent.....	5d.	5½d.	6½d.	8d.	10d.	1/1	1/4½	2/2½
Nett price	1/5	1/6½	1/9½	2/3	2/8	3/7	4/5½	7/3½
Labour fixing would cost about 50 per cent. on the gross cost of fitting, say..	6d.	6½d.	7½d.	9½d.	11d.	1/3	1/6½	2/6½
	1/11	2/1	2/5	3/0½	3/7	4/10	6/–	9/10

The cost of labour, &c., for running tube work is approximately as follows :—

Per ft. run, ¼ in., 2d. ; ⅜ in., 2d. ; ½ in., 2¾d. ; ¾ in., 3½d. ; 1 in., 4½d. ; 1¼ in., 6½d. ; 1½ in., 8½d. ; 2 in., 11d.—or about 50 per cent. of the gross cost of tubes.

The cost of fixing the fittings, elbows, &c., would be additional.

As a rule it is rather cheaper to form a "fire" bend than to use the ready-made article, as with ready-made bends it is necessary to make two joints, which give more opportunities for leakage.

In the bending of iron pipes care must be taken not to buckle the pipe, and to ensure this for the larger size pipes two or more heats in forge will be necessary. The smaller pipes may probably be bent in one heating operation.

There are various methods of making approximate estimates for pipe work. These are sometimes of use where the runs of pipe are not actually known, and it would, therefore, be impossible to take exact particulars.

A fairly reliable method is to take the approximate number of running feet of pipe and add on about 45 per cent. to the nett cost of the pipe to cover fittings. A special amount must be added for labour to suit the presumed conditions.

Another method of arriving at an approximate price is to find the approximate number of running feet of barrel, add on the probable cost of labour for running the pipe, and add 20 per cent. to the cost of both labour and materials to cover fittings.

Experienced estimators prefer to get the exact particulars required and quote accordingly.

In cheaper work malleable fittings are often used.

MR. FREDERICK JOHN DOVE.

We very much regret to announce the death of Mr. Frederick John Dove, of Messrs. Dove Bros., the well-known London firm of builders, which occurred on December 18. We hope to give a further account of Mr. Dove's career in our next issue.

BUILDING SURVEYORS' AND INSPECTORS' ASSOCIATION.

A GENERAL meeting of the Building Surveyors' and Inspectors' Association was held at Stoke-on-Trent on Saturday last, under the chairmanship of Mr. W. J. Stone (Chairman of the Association). It was resolved that steps be proceeded with for the formation of a London Area Branch of the Association.

At the conclusion of the official business, Mr. James Wilding, F.S.I. (Surveyor and Engineer to the Urban District Council of Runcorn), read a paper on "The Building Surveyor in Relation to Town Planning."

In referring to town planning, he said the knowledge of the suitability of the various parts of a town to carry various buildings was one of the greatest assets of the building surveyor. It was in that direction that the co-operation of building surveyors of large cities was of great advantage in the consideration of the schemes. No matter how desirable dwellings were, public buildings, factories and works would always take a prominent place.

Take the phase of town planning in which housing figured so prominently. Surely that was the domain of the building surveyor. By training, inclination and practice, every detail was familiar to him, and one wondered why men so peculiarly adapted had not played a more conspicuous part. Was it because their work was not looked upon as "creative," but "inspectoral"? If the matured experience obtained from years of contact with cottage

building had been used, would not the results have justified the building surveyor's inclusion in the scheme of things? He commended to them the idea—could not the work be more creative by expanding the scope of duties? Hardly a man in their ranks was without that intimate knowledge of detail which alone secured success, and all must have seen and noticed the impracticability of many well-meaning suggestions. Progress could only be made on a well-laid track; the pitfalls of building were better known to them than to those who spent their days only on design, and it was by knowing the failures that they were able to suggest remedies.

The roads and streets of housing areas were in a different category. Value was secured by keeping the building lines wider apart. The much abused "by-law" street was never the offender, but the commercial spirit which jammed the building line hard on its statutory width. Whether street or building, all came within the purview of the building surveyor.

Nearly every authority had schemes in hand—some completed, some in progress. Each surveyor often had one or more in his district; towns were spreading, slowly now, but with a promise of greater future speed. Why, then, should not building surveyors submit a series of suggestive reports on the possibilities they encountered. They saw the size of rooms; the good qualities or defects of the houses they inspected; they could often vastly improve, had they the opportunity—why not formulate all they could in the way of improvement? He believed there was a great desire in departmental circles to improve conditions and to welcome truly practical schemes.

COST OF BUILDING MATERIALS.

THE Ministry of Health issued, on December 19, the third interim report of the Inter-Departmental Committee appointed to survey the prices of building materials.

It states that since April last, fluctuations in prices of bricks had been comparatively small. In seven instances common bricks were quoted at a higher figure in the returns for October than they were in April, the increase in six cases varying between 2s. 6d. and 3s. 6d. per 1,000. In two instances decreases were shown. The Committee say they have not had brought to their notice any organised effort to raise prices by means of the operation of trade combinations, trusts, or agreements. Owing to the difficulty of obtaining immediate delivery of British-made bricks, in some quarters supplies had been obtained from abroad. The Fletton Association had only reduced their minimum prices, since the appointment of the Committee, by an amount approximating to the reduction in railway rates, and the Committee express the opinion that the Association might well take into consideration the question of a general reduction in their price.

With regard to light castings, the report mentions that there had been a considerable expansion in house building generally, carrying with it as a necessary consequence an increased demand for light castings, such as rain-water goods. There is, the Committee say no longer justification for the maintenance of the existing prices by the National Light Castings Association.

Sir Halford Mackinder, the Chairman of the Committee, in his monthly report, which is appended, states that a further advance in lead has been notified, while timber also, on the average, has increased in price. Common bricks have risen 3s. 6d. per 1,000 at Edinburgh, and, on the other hand, facing bricks in that district had fallen 7s. per 1,000. From Manchester a fall from 65s. to 60s. per ton was reported in British Portland cement. In the remaining materials no very appreciable change had occurred, but in the case of other items, such as nails and turpentine, prices appeared to be somewhat easier.

THE LONDON MASTER BUILDERS' ASSOCIATION

Annual Dinner.

ON Thursday last week, at the Hotel Victoria, Charing Cross, Mr. FRANK J. WALTON (President) occupied the chair at the annual dinner of the London Master Builders' Association, when some 420 members and guests were present. Among those present were Lord Burnham, Mr. E. J. Partridge (President, Society of Architects), Sir Wm. Mackenzie (President, Industrial Court), Mr. W. H. Nicholls (President, National Federation of Building Trades' Employers), Mr. A. J. Forsdike, Mr. T. C. Mansfield (Master, Worshipful Company of Tylers and Bricklayers), Mr. G. Topham Forrest (Architect of the London County Council), Mr. F. J. Gayer (President, Institute of Builders), Mr. C. G. Musgrave (Chairman, Metropolitan Water Board), Mr. G. W. Humphreys (Chief Engineer, London County Council), Mr. J. M. Theobald, F.S.I., Mr. George M. Burt, Mr. E. Wimperis, F.R.I.B.A., Mr. F. Shingleton, Mr. R. Angel, F.R.I.B.A., Mr. A. Roome, Mr. J. P. Williams (President, London Association of Master Decorators), Mr. W. H. Gascoigne (President, Association of Master Plumbers), Mr. F. Higgs, Sir Frederick Rice, Mr. A. G. White (Secretary, National Federation of Building Trades' Employers), Mr. S B. Depree, Mr. B. T. Luckett, Mr. W. B. Simpson, F.R.I.B.A., Mr. L. Shingleton, Mr. H. J. Johnson, F.S.I., Mr. D. G. Somerville, M.P., Mr. W. E. Collier, Mr. R. J. Holliday, Mr. Arnold Mitchell, F.R.I.B.A., Mr. F. M. May, Mr. F. W. Loasby, Mr. J. T. Mackie (President, London Builders' Foremen's Association), Mr. R. L. Roberts, Mr. P. C. Culver, Mr. A. B. H. Colls, Mr. F. Thorne, Mr. E. J. Brown (Director, London Master Builders' Association), Mr. H. T. Holloway, Mr. Roland B. Chessum, Mr. A. B. Falkner, Mr. G. Brittain, Mr. A. H. Adamson, Mr. G. E. Withers, F.R.I.B.A., Mr. W. A. Leaning, F.S.I., Mr. Harold H. D. Anderson, Mr. F. E. Wallis, Mr. H. T. Brammall Daniel, Mr. Ralph Knott, F.R.I.B.A., Mr. Sydney Tatchell, F.R.I.B.A., Mr. Wontner Smith, F.R.I.B.A., Mr. Walter Lawrence, Mr. F. G. Minter, Mr. Josiah Gunton, F.R.I.B.A., Mr. J. E. Drower, F.S.I., Mr. Ben Carter, Professor A. E. Richardson, F.R.I.B.A. Mr. C. L. Gill, F.R.I.B.A., Mr. H. Austen Hall, F.R.I.B.A., Mr. W. G. Newton, A.R.I.B.A., and Mr. W. J. Rudderham (Secretary, London Master Builders' Association).

After the loyal toasts had been honoured, Mr. HENRY T. HOLLOWAY proposed "The Architects and Surveyors." The toast he was proposing was, he said, always most cordially received at the annual dinners of the London Master Builders' Association, and the reason was not far to seek. Both architects and surveyors were held in the highest esteem by builders, and the relations which existed between those professions and the building industry were marked by sincere friendship. The position occupied by architects and surveyors to-day was one of immense importance, not only to the building industry, but also to the people generally. There was no doubt that the appearance of new buildings had an effect on those who lived in the neighbourhood; a beautiful building would have an uplifting effect, while the opposite would be the result from an ugly building. The architect had an extremely important function to perform in beautifying cities, and that this was realised was obvious from the excellent architectural schools in which the younger members of the profession were being educated to high ideals.

In responding on behalf of the architects, Mr. E. J. PARTRIDGE said although generally nothing but goodwill existed between architects and builders, at the same time it had to be acknowledged that in some instances there was perhaps a feeling of suspicion on both sides. It was the endeavour of the architect, as he knew it was of the builder, to overcome that suspicion, but there must be co-operation. The architect could not do without the builder, nor could the builder do without the architect, and without co-operation the various members of the industry would never attain the position they hoped to reach. In urging co-operation amongst the various branches of the industry, he also included the operatives.

Mr. J. M. THEOBALD responded for the surveyors, and said quantity surveyors were very proud of the cordial relations which existed between members of their profession and builders, and very much appreciated the sporting way in which builders accepted the decisions they sometimes had to make.

Mr. ROLAND B. CHESSUM, in proposing "The National Federation and its President," said he would appeal to those present to realise the tremendous responsibilities the Federation had in the welfare of the country generally, and he appealed to all builders to support the Federation. In his opinion the Federation was the only thing which would ameliorate the conditions of strife, and if architects would support the Federation more whole-heartedly by calling for tenders from Federated builders only they would considerably help that body in its efforts to avert strife. At the present time builders outside the Federation got all the benefits that body had obtained for the industry without bearing any of the burdens.

Mr. W. H. NICHOLLS, in responding, said the Federation was the best form of insurance the industry possessed. The past year had been a very worrying time, industrial problems were not getting any easier, and they had found that any measure of success which had been obtained was solely due to the loyalty of the members of the Federation. He thought London had a right to be proud of its new buildings, its architects, surveyors, builders, and operatives, and the aim of the National Federation was to bring about that condition of affairs which would enable the industry to carry on without friction. It was an aim of which they should all be proud. The employer should not only endeavour to get his living out of the industry, but he should do his best to make conditions better for all engaged in the industry, and that was the work of the Federation. They should endeavour to do something for the country as well as get something out of the industry, and there was no better way of combining business and the betterment of the country than by making their industry the channel through which they worked for the improvement of the condition of the country. England was to-day faced with problems such as it had never had to meet before, and that was partly brought about because a large proportion of the community were not able to live up to a good standard of comfort. Members of the building industry should take upon themselves the responsibility of uplifting their industry, for on the shoulders of building trade employers and operatives rested the responsibility of producing such a flow of labour that those conditions could be remedied at the earliest possible moment. But they would not make up for the work which had been kept back by bidding against one another for labour; they would only be able to meet the demand by bringing in an addition to the ranks of the industry.

Lord BURNHAM, in proposing "The Association," said there was never a time when he had so much reason to be proud not only of the standard of integrity, but also of humanity between employers and employed in this country; such relations did not exist in any other country in the world, and he had no fear whatever of the industrial future of this country.

Mr. WALTON, in response, said the Association was greatly indebted to Lord Burnham for the work he did at Tavistock-street. They had passed through a difficult year, but the matters in dispute had been referred to arbitration, and both sides were loyally abiding by the award. They were now looking forward to the sunshine of the New Year. In London the builders had every reason to congratulate themselves on their magnificent solidarity, and the Council had taken steps to organise the membership on a much larger scale; in this work they looked for the personal support of every member.

ELECTRICALLY OPERATED CURTAIN GEAR.

THE Society of Arts' meeting-room in ohn-street, Adelphi, derives its light in the ytime from a glass dome, the base of which 12 ft. in diameter and some 40 ft. above e floor level. The room is frequently used r lectures during the day, and to enable des to be shown it was necessary to devise ne means of rapidly darkening the room. the base of the ventilating cowl at the top the dome a circular iron ring was already existence, and to this twelve copper wires re stretched to the base of the dome, these rming the guides for the curtain. The rtain was constructed of black material, ade up in the form of an umbrella, in sec-ons to fit the space enclosed by the guide res. At the points which would be occu-ed by the ribs of an umbrella a series of ngs was sewn on the outside or top of the rtain, and threaded over the guide wires to pport it. The edge of the curtain was eighted round the whole of its circumfer-ce, so that when the main holding cord is released it would fall by gravity. ttached at equidistant points to the bottom d on the inside of the curtain are six short lling cords, joined to one main cord passing through the ring to which the top of the rtain and guide wires are fixed. The eration of opening and closing the curtain carried out by a small electric winding ar fixed at the base of the cowl. This gear fitted with limit switches, and is operated remote press-button control at the back of e room. To darken the room all that is cessary is to press a button, and the cur-in descends in about four seconds. This ethod of darkening the room was worked t jointly by the architect, Mr. A. T. lton, F.R.I.B.A., who was responsible for alterations to the Society's buildings, and ssrs. Edmundsons Electricity Corporation, d., Broad Sanctuary Chambers, West-nster, who carried out the whole of the w lighting scheme and special power re-irements necessary for experimental and er work in the Society's lecture-room.

ORROSION OF METALS.

A research on the subject of the Atmospheric rrosion of Metals is that being carried out by Atmospheric Corrosion Committee of the itish Non-Ferrous Metals Research Associa-n, and Mr. W. H. J. Vernon, B.Sc., the estigator, has just submitted his first experi-ntal report. The work has been carried out der the supervision of Professor H. C. H. rpenter, F.R.S., at the Royal School of Mines, l deals chiefly with the initial stages of rosion—the tarnishing of metals. Quantita-e measurements have been made on the rela-e behaviour of different metals and alloys, h indoors and outdoors. The subject is of ch importance not only to those who are cerned in the manufacture of metal fittings l articles, but in its direct relation to labour-ing in daily housework.

New Lambeth Bridge.

n connection with the proposed reconstruction Lambeth Bridge by the London County ncil, it is reported by the Improvements mmittee that it will be necessary to submit the Select Committee of Parliament, who l consider the Bill, drawings showing the posed architectural and artistic treatment the new structure. Time not permitting of imited competition among architects, Sir ginald Blomfield, R.A., has been approached, l has expressed his willingness to collaborate h the Chief Engineer and Architect of the ncil in the preparation of the design. It is ommended that his offer be accepted.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Brick-layers.	C'p'ters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4	1/0
Bedford	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4

(For rates of wages in the Building Trade in Scotland, see page 974.)

COLOUR COMPETITION.

IN connection with their colour scheme for a vestibule, Messrs. T. Parsons & Sons recently arranged for the presentation of the prizes for the best design (illustrated in *The Builder*).

This ceremony was performed by Lady Lavery. As many as 796 colour schemes were sent in from all parts of the country. These were adjudicated upon by Sir Edwin Lutyens, R.A., F.R.I.B.A., Sir John Lavery, R.A., Sir David Murray, R.A., P.R.I., H.R.S.A., Mr. Frank Brangwyn, R.A., and Mr. E. Guy Dawber, F.R.I.B.A.

Mr. Gordon Selfridge opened the meeting and expressed his great pleasure at being present. The object in view was most commendable. He particularly thought that they should encourage the younger members of the community to apply serious and constructive thought to the development of the genius which they possessed. The art of interior and exterior decoration was one to which the latent talent of the country could very well devote itself. They knew that there were numbers of people whose artistic merits should be developed, otherwise they would be left quite dormant.

Sir John Lavery, R.A., who was one of the judges, said that out of the seven or eight hundred colour schemes they looked through very few showed any real sense of repose. He did not mean by this that gaiety and brightness should be subordinated, but he did feel that the reckless use of primary colours irritated rather than soothed the beholder. They were more suited for the Orient, where the sun brought them into line. He remembered Whistler saying that he had brought the sun into London houses by the judicious use of black, white and yellow. Of course, there were other styles of decorations besides those of Japan, by whose decorative art Whistler was much impressed. To-day China and Persia had superseded Japanese influence, but those phases were largely a matter of fashion, though they undoubtedly played their part in the ultimate forming of tastes. In London the desire to see bright colours was a very natural one, but the more sparingly they were used the more telling and direct their effect.

Mr. E. Guy Dawber, F.R.I.B.A., in the course of his remarks said that those who travelled about must have been struck by the feeling of brightness and sense of gaiety of the Continental streets, largely due to the colour used in the painting of the outsides of the houses. Bright cream, yellow, pink, and some white, all added to the cheerfulness of one's daily life and had a noticeable effect on one's spirits.

He contrasted the drabness of our London streets, and urged the introduction of colour on the houses, and even suggested the white-washing, periodically, of such streets as Gower-street, to lighten the gloom with which they were hourly surrounded.

He pointed out the re-action which took place some twenty years ago from the garish wall papers of the Victorian period, to the opposite treatment of keeping every interior a dead white, until now another reaction had set in and colour was demanded on every hand.

They had to be careful, though, not to err too much in the other extreme, and lose their sense of proportion in the endeavour to be original.

Lady Lavery then presented the prizes as follows :—

Mr. E. A. Cox, 120, Adelaide-road, London, N.W.3., 1st Prize 100 guineas; Mr. K. Anns, 5A, Sinclair-gardens, London, W.14, 2nd Prize 50 guineas; Mr. A. W. Wall, 33, Bonnington-crescent, Sherwood, Notts, 3rd Prize 25 guineas.

She was honoured, said her ladyship, by being asked to present the prizes. She only wished there were more. She had seen some of the drawings, and she could not but think there were many of them that she would like to have given prizes to. Her husband suggested a scheme whereby the public could see them and pass an opinion on their merits. She thought that this proposal would be accepted by most people.

Sir Harry Newton then proposed a vote of thanks to Lady Lavery and the distinguished guests present.

THE SCOTTISH BUILDER

DIRECT LABOUR.

DIRECT labour in the building trade was referred to by speakers at the annual dinner of the Edinburgh, Leith and District Building Trades' Association, held recently in Edinburgh.

MR. J. R. WATSON proposed the toast of "The Corporation of Edinburgh," and warned the Corporation against using direct labour. A great deal of harm could be done in a very short time. They could not interfere with the industrial machine with impunity. He would not suggest that the consequences of direct labour would be as bad as in the case of housing, but they would be bad enough.

DEAN OF GUILD FORREST, in reply, said certain parties were doing all they could to get the Corporation to adopt direct labour. So far as he was concerned, he was dead against it.

MR. DAVID A. ANGUS (President of the Scottish Builders' Federation) replied to the toast of "Kindred Associations and Guests," proposed by Councillor J. Hay, and said the day had now come when Scotland and England, in the building trade, could not fight alone. The workmen were united, and what was good enough for the workmen was good enough for them. Their organisation was slowly being built up, and they were all working to one end—the benefit of the trade. After all, it was self-interest that must keep them alive. If they did not work for their own interests, they would be crushed out.

MR. HUGH D. FINDLAY (President, Glasgow Master Wrights' Association) proposed the toast of "The Edinburgh, Leith and District Building Trades' Association," and said the Federation had got clear of wages, hours, and conditions. These matters were now settled by a National Committee. That was a tremendous relief to the local Associations. If all Associations were linked up it would do away with direct labour, because they would be able to assist Corporations in furthering their building schemes. If Corporations were associated with the Building Associations, they would get more work, and would get it done at smaller cost than by direct labour.

THE CHAIRMAN, in reply, said direct labour was now being carried on by certain departments of the city. They had the tramway manager laying down rails. The Water and Gas Committees employed direct labour, not always to the benefit of the city. He thought Councils should do all they could to sweep away all work done by direct labour and place it out to contract.

NEW BUILDINGS IN SCOTLAND.

Glasgow.—It was announced at the annual general meeting of the contributors to the Victoria Infirmary which was held in the Merchants' House, Glasgow, that the Governors proposed to erect a pavilion for patients and also additional accommodation for nurses, at an estimated cost of £100,000, and that the erection of the Pavilion should be proceeded with early in the New Year.

St. Andrews.—The Town Council has decided provisionally, to erect 50 houses in the town under the Housing Act, 1923. The architect appointed for the work is Mr. Charles [illegible] Anderson.

Edinburgh.—The Corporation has adopted a scheme for the erection of 20 houses at Saughton hall-drive. The estimated cost of each house is £560.

Caldercruix.—At a meeting of the Middle Ward District Committee of the Lanarkshire County Council, held recently in the County Buildings, Glasgow, it was stated that in connection with the proposed erection of 50 houses at Caldercruix the all-in price of a room and kitchen house, according to the lowest tenders received, would be £470. A sub-committee has been appointed to go into the question of costs.

Greenock.—The Dean of Guild Court has passed plans submitted by the Greenock Industrial Society for new house in Prospecthill-street and for two cottages in Inverkip-road, for Mr. A. Jones.

Edinburgh Factory Fire.

A serious outbreak of fire occurred recently in the Middlemiss Biscuit Factory, Edinburgh, damage estimated at about £30,000 resulting.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick Masons' layers' Labourers.	Plasterers'

C. BENNETT, LTD. (193,652). Registered November 9. 68, Whitworth-street West, Manchester. Joiners, builders, contractors, &c. Nominal capital, £750.

THE SMOKE INSPECTOR'S HANDBOOK.*

IT is now two years since the report of Lord Newton's Committee on Smoke Abatement was published, and yet no action has been taken by the Government to enforce any of the suggestions contained therein. However, we have not yet abandoned hope that some Government in the not too distant future will see fit to lessen the immense waste of our national resources, to improve the health of the community, to bring sunshine into our town, to protect our buildings, to prevent a vast and needless expenditure in laundry, painting and cleaning, by revising and bringing up to date the regulations dealing with smoke emission.

When such an event comes to pass, the use of Mr. Clinch's book will be even greater than it is at present; meanwhile, it is fulfilling a very real need. Smoke inspecting requires considerable technical knowledge, and Mr. Clinch has assembled all the relevant matter in ten chapters, dealing respectively with Heat, Energy, Fuel, Fuel Combustion, Stoker's Work, Draught, Flue Gases, Smoke, Economisers, Boilers, and Mechanical Stokers. There is a short concluding chapter on "The Law Relating to the Emission of Smoke." But this is a matter which has been fully dealt with elsewhere. The book is amply illustrated.

Although smoke inspecting is a highly specialised task, and scarcely remotely connected with architecture, nevertheless it behoves the architect to know something of the conditions which tend to minimise the production of smoke, and the merits of the various methods of firing and of stoking—the latter not being, as is so often imagined, merely a matter of muscular energy, but rather a skilled job requiring knowledge and intelligence, qualities well worth paying for, since bad stoking must be the cause of an unnecessary loss of millions of pounds.

We think, therefore, that this book may be of more than passing interest to architects whose practice deals with factories. There is an interesting introduction by Mr. Cyril Banks (Chief Medical Officer of Health for the County Borough of Halifax), in which he points out that, although the domestic hearth is responsible for most of the smoke evils, this must not be taken as an indication that the smoke of factories is negligible. The smoke menace must be combated from every side, and all who desire to see an A 1 nation must take part in the attack.

Society of Engineers.

The following premiums have been awarded for papers read before, or published by, the Society of Engineers during 1923:—President's Gold Medal to Mr. J. W. Gordon, K.C., for his paper on "Railway Surveying by Photography"; Bessemer Premium (value £5 5s.) to Mr. Mauclere for paper on "The Pneumatic Handling of Petrol and Other Inflammable Liquids"; Nursey Premium (value £3 3s.) to Mr. A. Hiley for paper on "The Impact of Imperfectly Elastic Bodies with Particular Reference to the Effect of the Hammer Blow in Pile Driving"; Bernay's Premium (value £3 3s.) to Mr. A. Ferguson for paper on "A New Entirely Automatic Machine for the Mass Production of Glass Bottles"; Society Premium (value £3 3s.) to Mr. A. S. E. Ackermann for paper on "The Physical Properties of Clay (fifth paper) and the Dynamics of Pile-Driving"; Clarke Premium (value £5 5s.) to Mr. R. C. Hill for paper on "Work Beneath the Waves," read before the Gloucestershire Engineering Society, associated with the Society of Engineers; Geen Premium (value £5 5s.) to Mr. H. F. Jones for paper on "Boilers," read before the Crystal Palace Engineering Society, associated with the Society of Engineers.

*_The Smoke Inspector's Handbook_; or, _Economic Smoke Abatement_. By H. G. Clinch, M.R.San.I., M.I.A. (London: H. K. Lewis & Co., Ltd.). 7s. 6d. net.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

R. H. Maxted, Ltd., Premier Works, Hardwidge-street, Bermondsey, S.E. 1; stucco work and fibrous plaster, Plaster Decoration Co., Ltd., 30, Stannary-street, S.E. 11; ironmongery, A. Jones Lock Co., Ltd., 10, Dyers-buildings, Holborn, E.C. 1; vacuum cleaning apparatus, British Vacuum Cleaner and Engineering Co., Ltd., Parsons Green-lane, S.W. 6; and gas arc lamps, Gas Light and Coke Co.

East India-avenue.—After 150 years at the Royal Exchange, Lloyds, the famous firm of underwriters, is to remove to East India-avenue, Leadenhall-street. An area of nearly an acre has been acquired on the site of the old East India Company's quarters. The site reaches from East India-avenue to Lime-street. Altogether the scheme will involve millions of pounds. Sir Edwin Cooper, the architect of the new Port of London building at Tower Hill, is responsible for the plans.

HOUSING CONFERENCE

AT a Conference on Housing, held on Wednesday last week, at 4, The Sanctuary, Westminster, Mr. F. M. ELGOOD, F.R.I.B.A., said there had been volumes written and numbers of conferences held on the subject of housing, and he attributed some of the obstacles in the way of reform to apathy, thoughtlessness and ignorance. A large number of the population really did not know the conditions under which so many of their fellow beings lived. Education was, therefore, necessary, and it was proposed to inaugurate a Women's Housing Council in Westminster, to undertake work on the lines of the Council in Kensington, where public interest had been aroused and insanitary houses had been purchased and made habitable.

Mr. H. H. ALDRIDGE, National Housing and Town-Planning Council, suggested lines of remedial action, and said that, from the beginning of civilisation, the poor in every land had not been properly housed. In his opinion, the standard of wages should be raised, but housing reform should not wait for that, which might be fifty years. The money which was being wasted as the result of bad housing was more than the amount saved by leaving it alone, and, therefore, it could not afford to wait from the point of view of economy. A code of legislation had been placed on the Statute Book imposing certain duties on the local authorities, and it was their duty to suppress overcrowding by building houses and renting them to people at what they could afford to pay, and making up the difference out of the State funds. Before the question of housing could be solved, London would have to be considered as a whole in connection with transport and other things.

Miss S. M. BUSHELL, spoke of the desperate position of those who lived in slums and could afford to live in better houses if they could find them. She said the Women's Housing Council was to help the men: the question was not wholly for women, although, perhaps, they came more in contact with the overcrowding.

In reply to questions put by Mr. Cecil Smith, Mr. ALDRIDGE said that private enterprise had broken down, and the community must be prepared to pay the difference between the economic rent, and the rent people could afford to pay. The arrears of rent in municipal housing schemes generally were very low indeed. In Sheffield, they were high, owing to the very large amount of unemployment, and in many cases people were even going short of food in order to pay their rent. If confidence were restored in the building trade, private enterprise could get back to work and provide all the houses necessary, except for the very poor, who should be catered for by the State. He thought the only way to restore confidence, and to get houses built on a large scale, would be by the coming together of masters, men, the Ministry of Labour, Ministry of Health, and others, to form a housing policy spread over twenty years. The numbers of skilled builders had been extraordinarily reduced by the lack of apprentices, who were deterred by the small wages offered, and no guarantee of continuous employment.

Mr COURTHORPE (Western Australia) said the Workers' Board in his country was doing a great work. Anyone whose annual income was less than £400 could borrow £800 to build a house, the rent of which would be about seventeen shillings per week; and special facilities were made for people to travel to and from their work.

Obituary.

The death has occurred of Mr. Robt. S. Dawson, aged sixty-seven, of Chester-road, Sunderland, who had carried on business as a slate merchant in St. Mary's-crescent for nearly forty years.

The death has taken place, at Newport (Mon), of Mr. Robert William Moon, past-President of the Newport Master Builders' Association. He had constructed many buildings of note in Monmouthshire, including the National Provincial Union Bank, Ltd., at Newport.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

RAILWAY COMPANY EASEMENT: INCREASE OF BURDEN.

An interesting point to those who have land near a railway and have rights over level crossings has been decided by the Court of Appeal in the recent case, South Eastern Railway Company *v.* Cooper (*Weekly Notes*, December 1).

In 1844 the plaintiffs had constructed a branch railway, and by agreement they had acquired some land from the defendant's predecessors in title. The portion thus acquired had originally abutted upon a highway, but in making the line the highway had to be diverted, and the defendant's land was cut off from the highway. To restore this access and to connect several portions of the property a right of roadway and passage for themselves, their agents and workmen, on foot, or on horseback, and with carts, carriages, horses, and other animals, had been granted to the defendants' predecessors in title, their heirs and assigns over a level crossing, subject however to the by-laws of the Company as to level crossings, and it was provided that the defendants were to have a right of roadway "for the commodious use of the same crossing and the safe and commodious use of the lands thereto adjoining," and these rights were not to be cut down or interfered with.

The level crossing had always been used for agricultural purposes only, but the defendant had recently opened a sandpit on his land and used the level crossing to carry gravel and sand to the highway, and in this action the company had sought to obtain a declaration that the defendant was not entitled to so use the crossing as substantially to increase the burden of the easement by altering or enlarging its character and extent as enjoyed at the time the railway was constructed, and an injunction was asked for. The Court of Appeal, reversing the Court below, held that the grant was a grant in wide terms of a right of way for all purposes and not merely a grant of an accommodation way; that the grant was not so cut down as to show that the roadway was to be used for agricultural purposes only, nor was it limited to the user at the time it was granted in 1847. It was contended that the grant was so wide as to be *ultra vires* the railway company, but the Court of Appeal on the authority of a case, Rex *v.* Inhabitants of Leake (1833, 5 B. & A. 469), negatived that contention, holding that where it was compatible with the use of a railway company to make a wide grant of way subject to directions to be contained in by-laws, such a grant could not be held *ultra vires*.

"THE BUILDER" ARCHITECTS' & SURVEYORS' POCKET DIARY.

This diary, for the first edition of which there was a large demand, has been much improved by the substitution of a flexible leather cover, which will ensure that it does not become ragged after being carried in the pocket for several months. A thinner paper is used this year, so that the same number of pages are contained in a book occupying less space in the pocket. This diary is specially prepared for the use of architects and surveyors by *The Builder* in conjunction with the Architects' and Surveyors' Assistants' Professional Union (price, 2s. 9d., post free), and the first sixty pages contains a great deal of information required by members of those professions in their daily practice, including fire insurance, mensuration notes, tables of areas of circles, weights and measures, &c., a list of professional institutions, with notes as to membership, prizes and studentships offered, &c.; the new British Standard Sections; and a great deal of useful information under the heading of the different trades. The diary is arranged with one opening to each week.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXV.—No. 4221. DECEMBER 28, 1923.

COMMERCE AND ARCHITECTURE—II.

A RECENT architectural criticism in a provincial paper confirms the opinions we hold upon the necessity for a clearer definition of architectural and commercial values. The criticism of the architectural technique is excellent, but we are lost when the ritic embarks upon his hierarchy of commercial values. Again, re have the suggestion about the supposed greater dignity ttached to wholesale trading as opposed to retail trading. he foreign trader, we suppose, would be on a higher scale than he home trader, because the whole of his business would be onducted by correspondence, and his building might have the ppearance of, say, an insurance office! Probably the wholeale trader presents a less troublesome problem to the architect nd it is easy to make the problem into a question of dignity n architectural values); but if we are in the mind to set up thical standards in the chain of commerce, surely the manufacurer of the goods would be paramount. Or, in the same way, we are in the mood to criticise the quality of the goods there a tendency to blame the salesman, whereas it is the manuacturer who gauges the pulse of the market. We have recently ealt with the architectural dignity which we generally associate ith buildings for manufacturing processes, and we contrasted with the buildings and advertisements which we associate ith the selling departments of our modern civilisation. We ather from the criticism that the problem for the architect to express the dignity of the firm or firms which occupy the uilding. It will be noted how easily this gets rid of the disgreeable commercial function of the building and how easy would be to develop the idea into an expression of the wealth f the client. Ruskin gave us the æsthetic laws upon the orality of art standards, but we have lived long enough to e that many of his ethical assumptions were based upon deductive method of reasoning which ignored the possibility of ivilisation making any further progress. He gave us some elightful and interesting criticism, even if we do not accept his onclusions; he was intent upon certain important and neglected ualities in art, and these he detected unerringly. We have een a great improvement in the treatment of commercial rchitecture during the last twenty years; so much so that, like uskin, we are tempted into considerations of ethical values, st we have no architectural features left over to express the gnity and importance considered necessary for our public uildings. The truth is we are frightened of a dominant comercial age—yet we have lived under its rule for many years. is true that architecture is only beginning to catch up with he great commercial development of the latter half of the last entury, and we fear that much remains to be done before we an complain of an architectural world so uniformly dull because he work was so uniformly good. It may be a healthy development that architects should begin to think of social gradations their architecture as the standard of design improves; but e are not certain that architects generally are either capable making these distinctions, or that they have the architectural nge to satisfy them.

We have repeatedly pointed out that any system of graduated cial values is bound to lead to a conventional and hopeless ate of architecture. The cinema, for instance, is modern ough to place the problem beyond the imagination of the ncient Greeks. Many philosophers have expressed their doubts about the value of this popular development. It may or may not have much to commend it as a social factor in our lives; this is not our concern at the moment, but it is the concern of those who are determined to associate social values with architectural expression. Meantime, it is important to note that several of these buildings represent some of our finest examples of scholarly architectural work in the modern Greek style. We do not say this is a mistake; we merely point out the slender ethical basis upon which architects are building.

It has been suggested that as the principles of architecture become more widely understood architecture becomes more uniform, and gradually assumes the continuity and importance of a style. Under these conditions alarm is expressed at the social status of the commercial building, which would be as good as that of the public building. The only effective answer is that it is more reasonable to expect the architect to widen the scope of his architectural expressions than to narrow the list of subjects deserving of treatment. If the tendency of civilisation is to become more complex it is obvious that a limited architectural vocabulary would find difficulty in giving different expressions to the numerous manifestations of a busy world. To convey a sense of a hidden reserve of power is always difficult, and architecture suffers in this respect with all the other arts. It is merely a passing thought, but it seems curious that as the need, or rather, desire, for different architectural expressions increases, there should be a growing tendency to develop a style which (probably) is to a certain extent limited in its range. Any restriction of style is arbitrary, and care is necessary not to confuse an architectural style with the broad architectural principles which underlie every good design.

In a recent article upon "Digging Up the Greeks," Lord Riddell begins by suggesting a supposition that if by some strange process we could spend half an hour with an ancient Greek, what should we ask him? If he had the opportunity, this is what he thinks he would say: "Mr. Greek, can you tell me in a few words what enabled your small country to achieve such great things? How came it that the Greeks founded mathematics, physics, philosophy, and literature? What was the essential quality of the Greek mind." Probably he (the Greek) would reply: "Forgive me, I am tired of the subject. Let us discuss something more modern and interesting." It is a fascinating suggestion, and the idea occurs to us that architects would do well to develop the subject further. We have heard several architects speculating upon the outlook of the Greek mind upon architectural matters, and the general agreement was that the Greeks would have developed a finer architectural expression to our various types of buildings. We are not too certain about how the Greeks would have dealt with insurance offices, free libraries, municipal buildings, cinemas, warehouses, and motor depots. It is just possible that they would not pay too much respect to fictitious values and good form, and think too little of life and "the glittering noisy moment."

And, after all, if we never convince one another in our arguments upon the relations of art to commerce, it is not an established fact that the architect does give us the expression we would like when he is free from the chains of commerce. The only convenient analogy we can think of is in literature, where "a slight and elusive theme can be made to dance to the airiest pipings . . . a thing all music and light or it is nothing." Curiously enough the architect is not happy when lightness of touch and arrangement seem to be called for; everything seems to be treated alike, and the idea dies in his hands and is cold and stiff and formal. The assessors' report may say that the architect, whose design is placed first, is heavy and is not happy on the wing: nevertheless, our loss seems to be a small thing compared with the reassuring statement that the cloakrooms and exits are well arranged. From this it might appear that architects were more commercially-minded than they think.

NOTES.

The A. A. Pantomime.

THE pantomime, "So This is Architecture: Being a Nightmare with a Moral to all who take Life too Seriously," met with a well-deserved reception last week at the Y.M.C.A. Hall, Tottenham Court-road. The topical allusions were right up-to-date, and to those in or connected with the profession, and the inner workings of the A.A. schools, the incidents presented caused much amusement. The story commences with an architectural student who entered a competition. The effort proving too much for his overworked brain, he fell into a fitful sleep and dreamed the incidents so well presented in eleven scenes. Many of these scenes have been cleverly based on a successful popular play of to-day and much ingenuity has been displayed in so doing. All the scenes are worthy of mention, but space prevents this, though mention may be made of No. 2, "At Burlington House," where a demonstration of the much-discussed jury system for assessing competitions is witnessed. No. 6, "That Russia is always Russia," even in these days of enlightenment and Architectural Schools, proved another highly amusing scene, as also did No. 7, with its Early Victorian setting, all characteristic of the period; and No. 9, "That old Institutions need blood." In this scene Mr. "Riba" was operated on for a transfusion of blood from a more vigorous and youthful member of another body, viz., the "A.A." All ends well, as it should—the student awakens to find Fortune knocking at his door. The whole proved a creditable performance, all taking their various parts admirably. The scenery was all in character with the various scenes, and the orchestra well conducted.

The Building Industry.

THE building industry has its own industrial problems as apart from most other industries, but it depends for its prosperity upon the conditions in other industries. The economic exception which applies to building is the fact that the demand for and supply of houses are not regulated by a free market. The artificial restriction which applies to a section of the work of the building trade provides an excellent illustration of the economic principles put forward in Mr. Strachey's book on economics which we reviewed last week. Obviously, there are only two remedies for an artificial economic condition: one is to remove the artificial restriction (*i.e.*, the Rent Act); the other is to wait for an automatic solution, until building costs and rentals reach a economic level of their own volition. Th question is, How long have we to wait?

A Butterfield Letter.

THE following letter by th late William Butterfiel (1814–1900) which we re ceived a good many yea ago, is, we think, of sufficient interest t put on record in these columns. Thi letter was addressed from 4, Adam-street Adelphi, on December 28, 1878:—

"I am very sorry to seem uncourteous There are, however, several reasons wh I desire that my works should be illus trated as little as possible, besides that o preferring to live as quiet a life as my wor will allow me to do; my natural disposi tion inclines me strongly to this. One o my reasons for declining publication of m works is that my most frequent treatmen of architecture is largely dependent on and connected with, coloured materials I should be sorry to see such works pub lished unless that treatment could be don justice to. I think I may have said thi to you on a former occasion. I hav always had regret when I have at all give way in the direction of publicity. It i no way suits my taste to do so. I ca therefore only hope that people like your self will charitably understand me in thi and similar matters. I am, my dear —— yours very faithfully, W. BUTTERFIELD." It will thus be evident that he greatly valued his mural schemes, and to such a extent did Butterfield allow his love o patterned colour to govern his action that on one occasion, seeing some college buildings which he had erected being more or less encroached upon by climbing foliage, he ordered the gardener straigh away to cut down the creepers and forth with dig a wide trench round the premises filling in same with concrete to prevent further risk of any similar interference with his design in future.

Boughton Malherbe Panelling.

THE regret which we must feel that this famous panelling should now be on exhibition in New York, it having been acquired by the firm of Charles, may be tempered with the thought of the great wealth of this country in such traditional memorials of the past The recent publication of a further volume of the Essex Survey (Historical Monuments Commission) reveals to us that in Essex alone the record of monuments reaches to the total of 5,506. The wealth of this country in historic and artistic possessions of interest is very great, and though the large number recorded in Essex includes many of very minor importance, they are none the less of ancient origin and represent many examples of widely divergent character. No doubt the Wotton panelling is of exceptional interest and beauty, and has been known to antiquaries "as one of

Mountsorrel War Memorial: Showing the Butter Market in the Foreground.
MESSRS. STOCKDALE HARRISON & SONS, Architects. (*See p.* 994.)

the best preserved specimens of its kind in England," according to the account appearing in *The Times*. The whole of the room has been reconstructed in the galleries of the New York firm, and measures 19 ft. by 19 ft., and is about 13 ft. high.

Villa Carlotta.

THE many thousands who have visited the lovely shores of Lake Como will learn with regret that the Villa Carlotta, which came into the possession of the Italian Government under the terms of the Peace Treaty, is to be dismantled, and its treasures transplanted to Rome, after removing the rare plants for which its terraced gardens are famous. The historic associations of Lake Como suffer a loss in this way, and it is much to be hoped that before too late something in the nature of international protest will be made against this act of spoliation. The grounds adduced, those of economic necessity, are not, we should have thought, of equal importance with the advantage of preserving the beauty of such historical associations, which influence, hardly less than the beauty of the district, so many thousands of tourists to visit the neighbourhood.

Pavilion de la Reime, Les Baux, near Avignon.

We understand that there is even danger that the house itself may be pulled down. Its late formal style, though perhaps not of the best, is singularly suited to its situation in that it is wholly local and distinctive, and has received the eulogium of John Ruskin in one of his writings. The Italian Lakes have perhaps suffered less than other localities from a cosmopolitanism which takes little heed of local and traditional characteristics, and we trust that the inhabitants who are opposed to the destruction of their famous Villa will succeed in the appeal which they are making to Rome, and that it may be preserved to give pleasure to the thousands of tourists who haunt the shores of the lake each year.

St. Botolph's Church, Bishopsgate. From a Sketch by MR. W. J. B. PRICE.

William Blake's "Milton."

AT Sotheby's there has just been sold this volume for the sum of £3,400, and it is understood that it will now go abroad, probably to America. It was Goethe who said that the artist was not paid, and the sum now realised by others for this book is more than William Blake through half his lifetime received for his work when alive. Yet the poet, when talking in his old age to a little child, is recorded to have said to her: "May your life be as happy as mine has been"; from which various inferences may be drawn as to where the profit in life lies, since one so gifted could give up so much to gain so very much more.

GENERAL NEWS.

Change of Address.

After December 3 the address of Mr. Geo. T. Morris, M.C.I., will be 24, Portugal-street, W.C. 2.

Professional Announcements.

Messrs. F. Palmer & G. F. Armitage, of 47, Leys-avenue, Letchworth, are dissolving partnership at the end of the present month, and from January 1 onwards the Welwyn business will be carried on at Bridge-road, Welwyn Garden City, by Mr. F. Palmer, and the Letchworth business at 47, Leys-avenue by Mr. G. F. Armitage.

York Minster Window.

So far the amount subscribed to the fund being raised by the Dean of York for the renovation of the stained-glass window at York Minster amounts to over £27,000. Donations may be sent to the Dean of York, The Deanery, York.

Hemsted Estate Sale.

Nearly 2,000 acres on the Hemsted estate were offered for sale by auction last week by Messrs. Winch & Sons, in conjunction with Messrs. Curtis & Henson. All but two small lots found purchasers, the proceeds of the sale amounting to £28,061, exclusive of timber valuation. It was stated that Hemsted mansion had been sold for a girls' school.

St. Olave's, Tooley-street.

The site of St. Olave's Church, Tooley-street, London Bridge, has been disposed of for approximately £10,000. The work of demolition has not yet commenced, but it is ordained by Act of Parliament that the fabric shall be pulled down within a certain period after the completion of the sale, and that observation shall be kept for any ancient foundations which may exist. Ultimately the site of the church will be utilised for a warehouse.

COMPETITION NEWS

Talbot Memorial Park.

Design for a Lodge and Main Entrance Gates. A premium of 20 guineas is offered, and the successful architect will be engaged to supervise and carry out the work. Sending in day, January 20, 1924. (See advertisement this week.)

Dunfermline War Memorial.

FOR THE DUNFERMLINE WAR MEMORIAL COMMITTEE.—Designs for a monument to be erected at a cost of £3,000. On receipt of £1 1s., which will be returned on receipt of a *bona fide* design, competitors will receive conditions of competition, plan of site, and photographs of surroundings. The assessor is Sir John J. Burnet, A.R.A., R.S.A. Sending-in day, January 1, 1924.

Monument to Sir Wilfrid Laurier.

The Canadian Government has inaugurated an open competition for a full-length statue of the late Sir Wilfrid Laurier to be erected in the grounds of the Parliament Buildings, Ottawa. Designs are to be in the form of sketch-models in plaster. The author of the selected design will be given the commission to carry out the work, and the author of the design placed second will be awarded a premium of 1,000 dollars. The cost of the memorial and pedestal is not to cost more than 25,000 dollars. Sending-in day April 3, 1924. Further particulars from the Secretary, Public Works Department, Room 784, Hunter Building, Ottawa. (The conditions, photographs and site plan may be seen at the office of *The Builder*.)

Heating and Lighting Scheme, Belfast Union.

FOR THE BOARD OF GUARDIANS.—Installation of heating and lighting plant. Premium for best scheme submitted, 100 guineas. Sending-in date, March, 1924. (See our issue for Nov. 9.)

Design for National Theatre.

The sending-in date for this competition is April 26, 1924.

City of Hereford.

Designs for the reconstruction of the market hall and adjoining premises. Full details can be obtained from the Town Clerk on the payment of £2 2s. The premium is £100; and the architect whose design is selected will be appointed to carry out the work.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Singapore College (Jan. 1, 1924; March 30). Dudley Memorial (Jan. 5, 1924; Sept. 14). Memorials to the Missing (Jan. 1, 1924; Aug. 3). Newcastle Concert Hall (Feb. 1, 1924; Oct. 26). Essays on Concrete (Dec. 31; Nov. 16). Essays on Heating and Ventilating (Mar. 31, 1924; Nov. 9). Holmside Hospital (Feb. 14, 1924; Dec. 14). Industrial Designs (June, 1924; Dec. 21).

"THE EASTERN GATEWAY."

In sending the sketch, reproduced below, of the view from a window in the office of the Architectural Department of the L.N.E.Rly. at Liverpool-street Station, Mr. W. J. B. Price says the object has been to depict the complication of London's skyline and to show the disfigurement due to the conglomeration of chimney pots. In the background the four pinnacles of the tower of St. Michael's, Cornhill, and the cupola of the Royal Exchange can be seen. The title is chosen only to suggest a comparison between the modern Liverpool-street Station and the mediæval Bishop's and Aldgate which it seems to supplant.

"The Eastern Gateway."

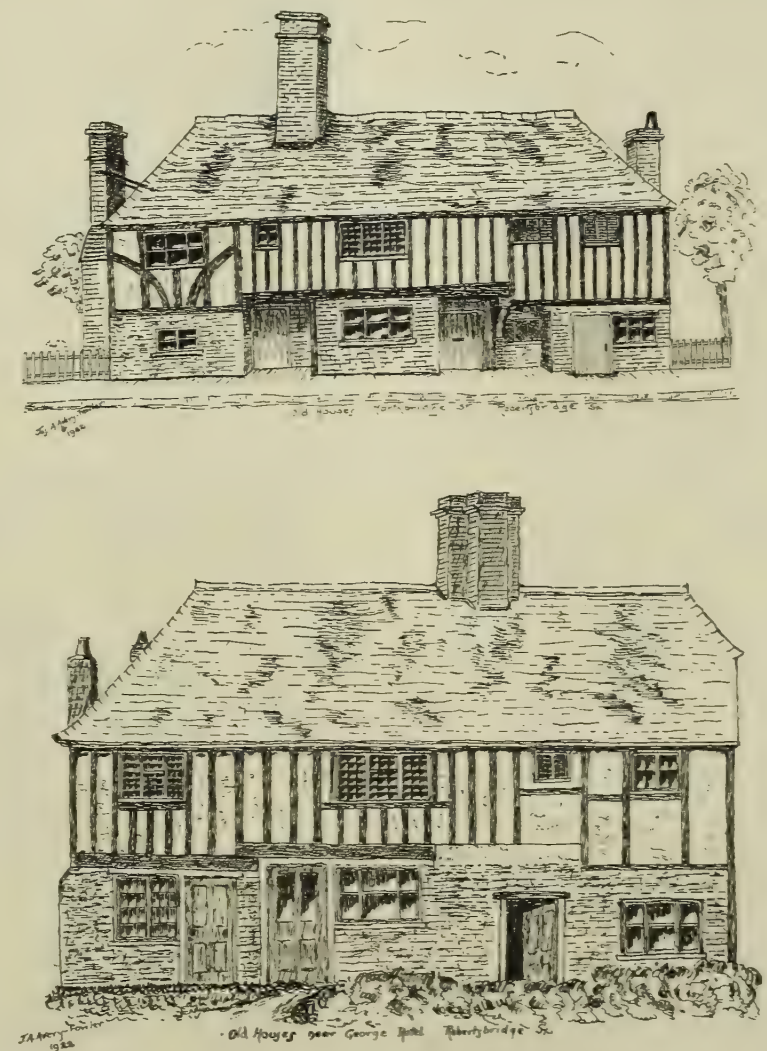
From a Sketch by MR. W. J. B. PRICE.

THE COMPLEAT ARCHITECT.

By DUDLEY HARBRON.

No. XI.—FITNESS.



FINE buildings are put to uses quite other
n their authors intended, but no fine building
s ever conceived which did not in its original
tability fulfil the requirements of its occupiers
ts very excellent qualities spring from the
isfactory solution of these wants in their
bodiment in building. It is easy to trace how
ial, symbolism, law, system of communi-
ion, and a hundred and one other conditions,
l and assumed, have had their influence
on the buildings of the past; but whilst they
ect intention and modify fitness, their effect
outside æsthetics. Fitness is attained when
ention is realised. There is no path except
t formed by the artist, or in the footprints
other artists who have gone before. In
tching students at work upon a given theme,
is interesting to note their difficulties. In
ir earliest stages, those of them who have any
swer to offer to the problem posed have only
e, and this they are incapable, or unwilling, to
sake, even when the answer contains un-
stakable absurdities. The errors are due in
st instances to an imperfect realisation of
ention, not to any insolubility of the problem,
lack of content wherefrom to frame an
swer. The right understanding of the question
he first necessity to its solution, but it should
qualified by suitable or satisfactory, which,
turn, equates fit. That there are several
utions any selection of competition drawings
l demonstrate. That there is a suitable
ution is the only justification for the appoint-
nt of the assessor. Every competitor, doubt-
s, honestly considers that his personal set of
wings is the best, until he sees the others
mitted and reads the award, when he
uld find himself in agreement with the
essor. It is when the intention has not been
ly realised, or when difference of interpre-
ion are trivial, that disappointment and
pute occurs. For if the assessor is competent
l honest, he will doubtless be right—indeed,
has the best opportunity to be right of any
us in this imperfect world. When the assessor
s, it is when, having awarded the first place
a design upon certain grounds, he awards the
ond to some radically different solution,
en there are plans which more nearly resemble
e successful competitor's that should, if his
st conclusion were right, be in fairness given
e next place. Competitions being judged,
en, on the nearness with which they realise
e intention of the promoters, that is, their
ness, it will readily be grasped how important
factor it is, and from the rarity with which
win them, how difficult to attain. Conveni-
ce in every particular is that which has to be
ught after. It sounds very simple, but, in
uality, it calls for constant vigilance; its
king leads to continual change, refinement
d progress. That which is unfit is self-con-
mned. Fitness is not solely concerned with
e plan of a building; it permeates all the
ails and subsidiary parts, lying in wait to
p us down dark corridors, and catch us on
necessary hooks. The doors, the windows,
e stairs and balustrades, must have some
ation to the needs of the frequenters of the
ilding. Except they are suited to the amount
traffic which it is estimated will pass through
em, doors may very easily be incongruous;
ere are other implications beside traffic, as
emonial uses influenced the western doorway
the cathedrals and sun worship Egyptian
mple doorways; but, in every case, they
uld be, and not seem to be, significant. Fitness
not only contained in significant form, but in
e worthy employment of material and its
per handling by the workman.

Material ought to respond to the forces tending
its destruction, and its handling should be in
h a fashion as will aid its natural qualities
resistance. Although in pure æsthetics, form
independent of material, and marble and bronze may be considered indifferently as equally appropriate for statuary, none the less their form is not identical, even when they endeavour to represent the same form. If we imagine a work of art in snow, though conceivably the form exist momentarily æsthetically satisfying, the mind would find that fitness were lacking and deem the artist's efforts misapplied upon such fugitive material.

It is well understood that substitutes and subterfuges, equally, are condemned, no matter how cunning or clever. With all the knowledge of our time, we may make blunders, but to err deliberately is to court failure. Willy-nilly architecture has to conform to the touch and test of fitness. It is iconoclastic in its influence.

The preservation of buildings æsthetically celebrated is only accomplished as a result of considerable outlay, and this is directed to the elimination of their inconvenience entailed by their maintenance in a situation out of all recognition different from that in which they originally grew. Whitgift Hospital and the City Churches are examples. Former ages had no such sentiment. In these two cases, it is not the building, but the environment which is at fault. The veneration of ancient buildings may become an incubus and do injury to contemporary citizens. We are a sentimental people and put up with outworn conventions long after we know them to be wrong. There comes a time, however, when, in the interest of self-preservation, we are obliged reluctantly to make a move forward, to enact that haystacks shall not be erected within the city walls, nor roofs thatched, to prohibit timber framing, and so down the centuries to our present problems. Followed to its conclusion, fitness demands that nothing that has ceased to justify existence need survive, and insists that nothing that does not respond to the call of humanity be created. It has been formulated as a creed by the Italian painter and poet Marinetti, who holds that every work of art over twenty years old should be destroyed. We are not prepared to go to such artificial extremes, although there are indications on all sides that the chains of the past hang too heavily about the present. Roads which to-day meander as some far-gone lover wandered through the fields to his tryst, must to-day give place to less romantic rule. Though we isolate and preserve our monuments as footsteps in the Via Appia, fencing them in and tinkering them up, the elimination of the unfit works its unseen will. Useless corners, protuberant features, by what we know to be the nature of things, are doomed to perish. Designers should profit by this obvious lesson—jolts and jars will work their will. The urge seems unkind in its implications, and its speed hugely accelerated by the strenuous, tireless, activity of machinery; we want somewhere to rest. Only when we reach a stage not yet discernible will this be.

We are in the beginning of a renaissance, the ultimate reach of which no man can foretell.

XV–XVI–Century Houses at Robertsbridge, Sussex.

From Sketches by MR. J. A. AVERY-FOWLER.

CORRESPONDENCE.

Devonshire House Site.

SIR,—I venture to trespass on your time, as the Devonshire House site is a matter of general public concern. It is roughly 200 ft. wide and 700 ft. long, after allowing for the widening of Stratton and Berkeley-streets. It is so large an area that if covered with shops and places of amusement the already congested state of the traffic would be made ten times worse. At present the torrent of traffic is so terrifying that a pedestrian has to perch on a refuge and pray for a policeman. On such a site shops would greatly damage the value and residential character of the immediate neighbourhood.

Are we such a "nation of shopkeepers" that the mere fact that bigger rents are paid for shops than for residences is sufficient reason for spoiling the very centre of the Empire?

On this site there is room for three towers of the size and majesty of Pugin's Victoria Tower at Westminster. Surely no one will deny the great beauty and dignity of that tower? Three such towers could be created on the Devonshire House site, and each tower would be 100 ft. away from any other building all round, and would rise from a belt of trees 5 ft. wide. Nobody's light or air need be interfered with in the least degree. The traffic, if such towers are built as residential flats, would be hardly perceptibly increased, and the flats themselves would be both airy and quiet, commanding most interesting views.

Each tower, if 100 ft. by 100 ft. by 300 ft. high, will provide 120 residential service suites of five rooms each. Every suite would have two exits, with access to its neighbours, and in case of emergency, the roof being flat, firemen can operate on any of the three towers. Each suite has its own stone staircase for emergency escape with exit at the bottom out of doors. The inner court, which is 26 ft. square, is for service and drain-pipes and permanent fire-escapes, and has two outlets to the street.

I have lived for six years in a building in St. James's-street containing 30 suites (the same number as in the above scheme) with only one lift and one exit, and invariably at all times of the day and night I go in and out and never meet a soul except the hall porter, although every flat is always let.

Traffic to the three towers would have six drives for setting down and picking up without having to turn around.

I attended Mr. Raymond Unwin's lecture to the R.I.B.A. last Monday week, and was amazed that neither he nor any subsequent speaker mentioned the great difference between the traffic of a shopping quarter and a residential one.

The L.C.C., no doubt, will allow the Devonshire house site to be covered with shops, but they will not even consider the three tower scheme.

C. F. A. VOYSEY.

Charlatans and Pests.

SIR,—I have been very much amused at the correspondence under this heading and the various ideas expressed by the writers.

Some architects appear to be very sore over the idea that anyone should draw a design or plan of a building and be outside of their profession.

What about the professional builder or estate developer who draws his own jobs? Is he to be debarred by a registration backed by Act of Parliament from pursuing his business? Or what about the ladies who have designed houses for themselves all over the country, and made a good job of them, too! Are they to be tied down in their efforts to improve the home? Not every architect is given the wit or brain to elucidate the problems in house and home building.

Let architects prove their worth as able designers, just as any builder has to do, and if they are successful they will have nothing to fear. Associations or societies don't give men brains; and, after all, are just trades unionism, which most architects abhor. Then why drag the medical profession into the discussion? Don't we know, as men in the street, that there are doctors *and doctors*, and all are in their societies, which does not make them better or worse doctors?

A very vital fact in relation to all this talk is the patent fact in life that all discoveries, improvements, and innovations are not generally brought about by the people in trades and professions, but by lobbyists and rank outsiders, who are sometimes ranked as pests. We should all remember the recent triumph of manipulative surgery.

J. H. EDWARDS.

Protection of Iron and Steel.

SIR,—Will some of your readers who have a knowledge of steel and iron work—both internal and external—kindly give me the benefit of their experience as to why metal cannot be as successfully preserved with tar as with red oxide or red lead? I have always been under the impression that the standard practice was to paint all steel and iron structures, bridges, &c., with one of the two latter, but have just come across a specification which calls for all the iron and steel work, both inside and outside a factory, to be tarred.

"ENQUIRER."

"Can Tarnishing be Prevented?"

SIR,—Your correspondent under this heading in December 14 complains of silver and other wares tarnishing even when wrapped in cotton wool and other things.

His description of the building leaves a good deal of necessary detail missing which it is very necessary to know before a definite opinion can be passed on what may be the cause.

1st question would be: Is there a proper damp course at ground line above foundations?

2nd question: What materials are used in making the concrete floors?

3rd question: Is there a sufficient number of ventilation gratings to ensure a free passage of air all through the building?

4th question: Is there proper up-cast ventilators at top of building to carry off condensed moisture?

5th question: What kind of mortar is used in the building of the brick-work?

6th: Is there any provision for excluding moisture which may drift through at window heads and sills in the nature of a damp course for instance?

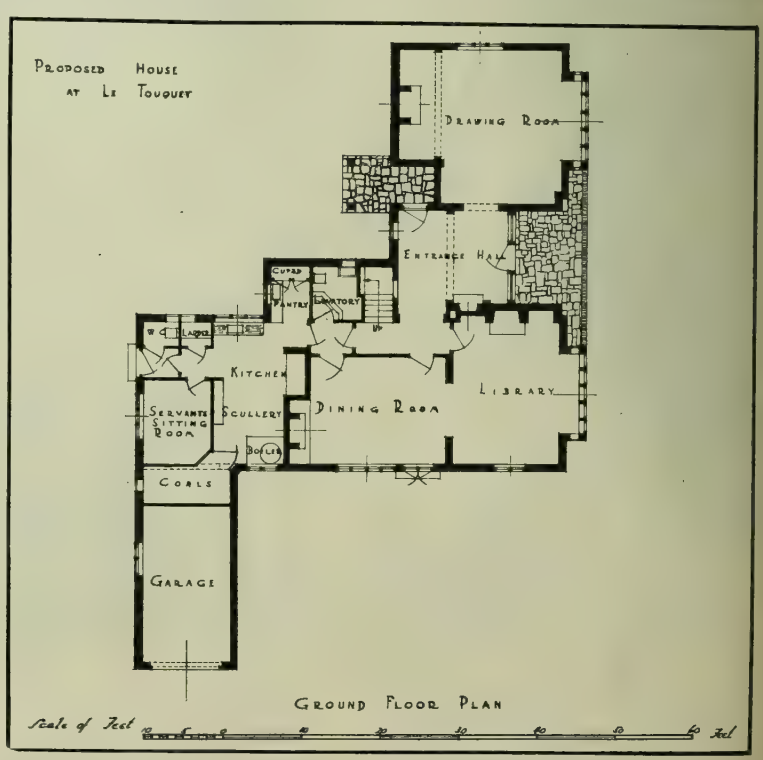
7th: Is there any chance of the site being in a damp situation and the probability of ground air rising inside of the building?

8th: Was the building erected in wet weather and has sufficient time been allowed to dry out before occupancy?

These and a number of others, which any builder or architect may reasonably ask require to be considered on the spot before any definite case can be stated.

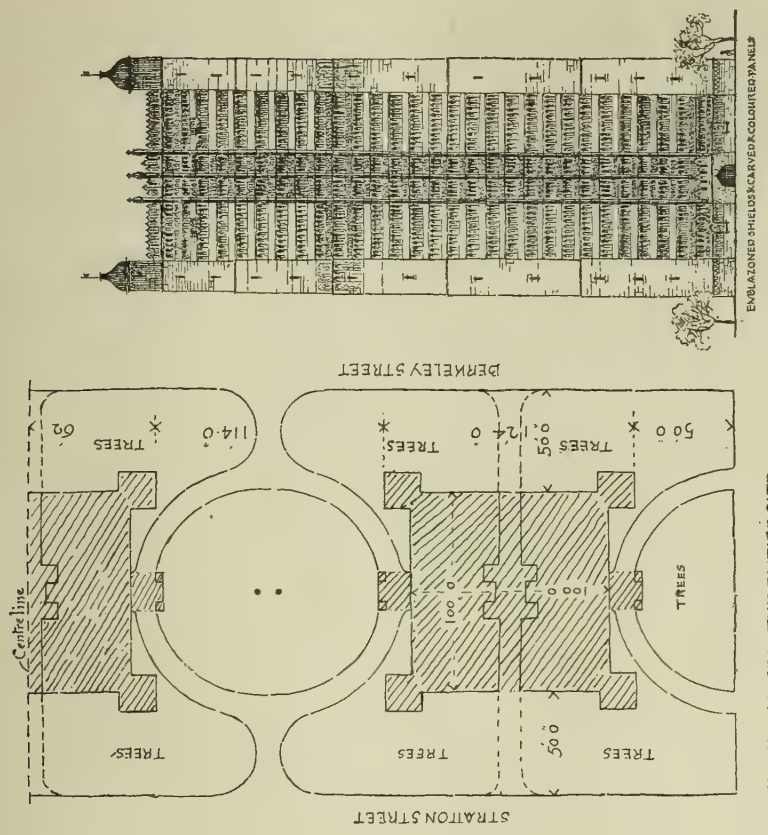
If the correspondent cares to state a little more in a future issue the writer would be pleased to try and help.

J. H. EDWARDS.



SIR,—Your correspondent inquires why silver goods wrapped in cotton wool and packed in cardboard boxes should tarnish in a particular building. The cause is almost certainly due to the fumes from the gas radiators used for heating the store. He may be interested to know that a special quality of tissue paper is obtainable which would protect the silver to a greater extent. Also that before very long untarnishable silver will be obtainable.

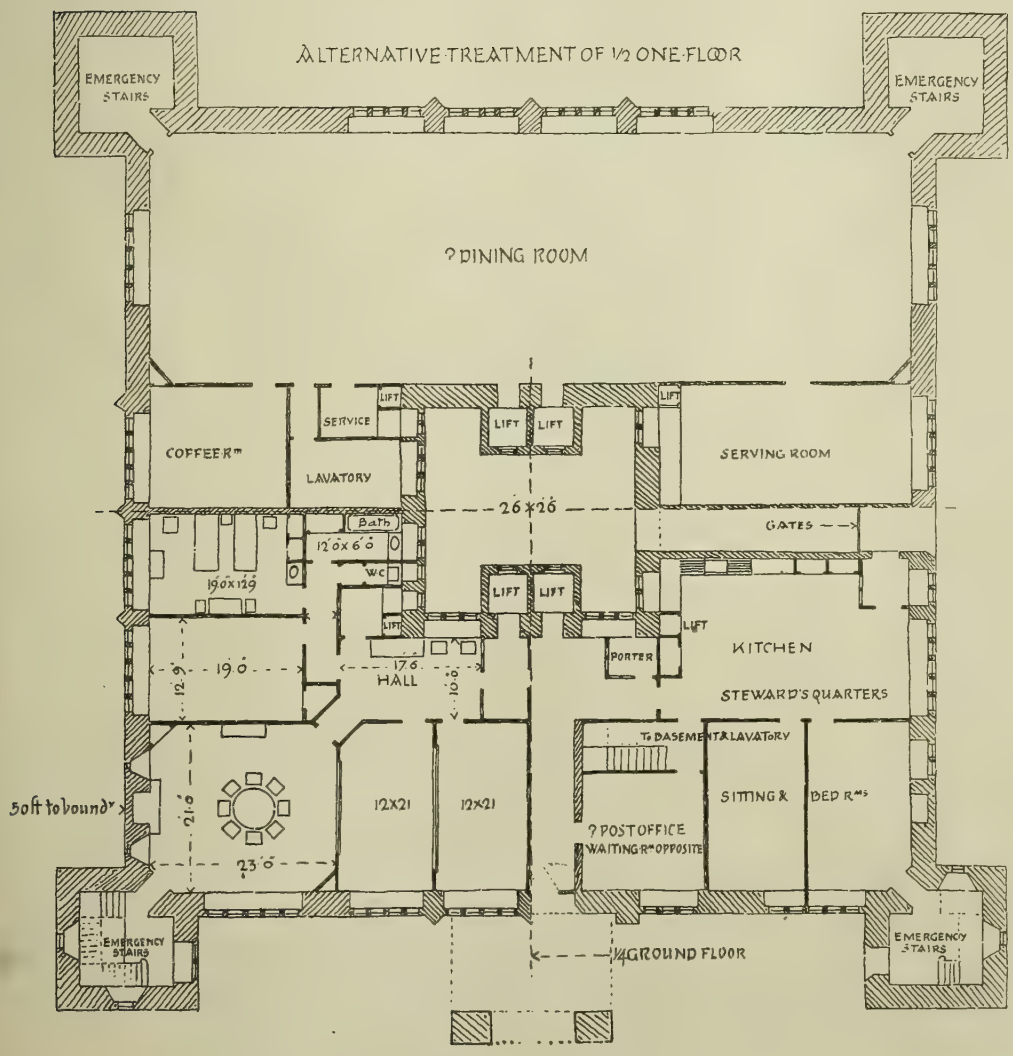
F. HERBERT MANSFORD.



SIR,—Your correspondent in propounding this conundrum in your issue of December 14 gives a number of details as to the construction of the building, but omits some more important data. For instance, is the building in a busy industrial centre or a country town?

Tarnishing of silver is almost invariably due to the presence of traces of sulphur gases in the air surrounding it. In the air of a manufacturing town there are generally sufficient traces to cause tarnishing. If this explanation does not serve, the most significant item in the data given is the heating by gas radiators and absence of flues. This suggests the quality of the gas as the source of the trouble. To determine whether the particular sulphur gas which causes tarnishing is present in the air of the store-room is quite simple. Cut a piece of filter paper into strips—about three inches by half-an-inch will do—and dip one end in a solution made by dissolving nitrate of lead in water. Suspend such strips adjacent to where the silver is stored—if the moistened part gradually turns brown impurity in the air is indicated. The remedy is either to purify the air or prevent its access to the silver. Neither cotton wool nor tissue paper are impervious to air. I suggest either wrapping tightly in waxed paper or coating the silver with colourless lacquer.

NOEL HEATON.



House at Le Touquet, France. MR. A. B. LLEWELYN ROBERTS, Architect.

BLOCK PLAN OF ½ THE ENTIRE SITE.

PICCADILLY.

SCHEME FOR DEALING WITH DEVONSHIRE HOUSE SITE.

(See letter by Mr. C. F. A. Voysey on previous page.)

BIRMINGHAM ARCHITECTURAL SOCIETY.

A somewhat scathing indictment of Birmingham's defects, more particularly from an architect's point of view, was made recently by Mr. Rupert Savage in his presidential address to the Birmingham Architectural Association, entitled, "The Renaissance of Birmingham."

The Renaissance of Birmingham, he said, was not only inevitable in the natural course of growth, but was a movement much overdue. There were few who would deny that Birmingham—the greatest city in England, excluding London—presented an outward aspect unworthy of its commercial greatness. The present state of the city might be summarised as a huge agglomeration of human beings crowded into a formless mass of mean streets and shabby buildings. It had never been planned; it had simply grown in a shapeless form dictated by the apparent needs of the moment. Considering its great size Birmingham was singularly lacking in fine main thoroughfares, and there were few streets having any pretensions to size or dignity. It was a mass without a nucleus. The main roads leading out of the town were ill-defined and tortuous. There were few open spaces, and such as existed were irregular in plan and devoid of buildings of a monumental or impressive character. The shopping area in the centre of the town was small and inadequate, while in the nearer suburbs were miles of miserable shops, the very existence of which seemed superfluous. Some of the outer suburbs were healthy and pleasant, but older residential districts in the inner wards could show large slum areas which could compete in wretchedness with any town in England. The public buildings were few and scattered, and whatever merit they might possess was largely discounted by an absence of logical grouping.

This might appear a somewhat exaggerated indictment of the city's shortcomings, but he wished to emphasise the evil in order to emphasise the necessity of remedial measures.

A commercial aptitude for buying in the cheapest market and selling at the highest price might lead to acquisition of wealth, but was certainly not conducive to an appreciation of the higher aspect of life; nor did it engender a mental attitude favourable to merely æsthetic considerations. But it was just this commercial spirit which was to-day the great bar to all advancement in purely cultural and æsthetic moods in Birmingham. What was needed was vigorous and enlightened leadership. Mr. Neville Chamberlain recently spoke in strong terms respecting the necessity for civic improvements, but he stressed the social rather than the æsthetic side of the question. Amongst the ranks of the City Council there were a number of capable and energetic workers in the cause of betterment, but their energies were directed to strictly utilitarian projects, and there were few indeed who had any lively conception of the great moral value of abstract beauty. Dealing with these aspects of the "betterment" question which more closely concerned the architect's profession—viz., the improvements in town planning and street architecture—the President said the first step was to arouse the interest and enlist the sympathy of the man in the street. The second step was to make a general survey of future developments. The third, and perhaps the most important, was to ascertain what could be commenced now and accomplished during the present generation. There already existed a number of agencies for arousing the interest of the general public and promoting civic patriotism. It was to be hoped that the united efforts of these bodies, aided by a sympathetic attitude on the part of the civic governors, might ultimately elicit some response from their rather unresponsive fellow-citizens. When they came to survey the programme of future developments they quickly came up against the fact that they were dealing with a full-grown (if badly developed) town. Town-planning enthusiasts were apt to forget the existence of vested interests and seated industries, and seemed to think they were planning a new city on an open plain. In the centre of their town, particularly, it was impossible ruthlessly to demolish whole thoroughfares and extinguish old-established commercial interests. Courage and foresight were requisite in preparing a scheme for controlling the future development of the town, but there was also need for a judicious blend of idealism and common sense. Unrestricted idealism might become a serious obstacle in actual achievement. The City Council had been engaged for some years on the task of town planning Birmingham, and much useful work had been done. While they recognised the effort that had been made they, as architects, were inclined to feel that the work done had been influenced solely by technical considerations, and that the æsthetic aspect of town planning had been insufficiently recognised. In many towns the work had been placed in the hands of experienced architects, but in Birmingham it would appear that road-making, sewerage, and traffic control were the sole consideration. There was a very marked contrast between the status of the architect in this country and abroad. In most European countries, and in America, the architect was an important factor in all civic developments, and as a result they saw a remarkable difference between their own towns and those they visited in their foreign travels. What they might hope for, and plan for, in the future development of the city was a complete and comprehensive town plan of the town and suburbs, with due regard to the architectural and artistic aspect of the subject. They also hoped to see the erection of a public hall adequate to the needs of the city, and the provision of a really fine exhibition hall to replace the obsolete Bingley Hall. They might see the renovation of the fine Market Hall, and the rearrangement of the wholesale markets on a coherent plan.

Something ought to be done in utilising the rivers to form an agreeable adjunct to the street scenery, and in the outlying districts the streams and watercourses might be made pleasant features of the public open spaces. The question of slum clearance and provision of new homes for workers was a matter of urgent necessity.

As to what could be done now, or in the immediate future, as the contribution of their generation to the greater scheme, the lecturer urged that the City Council could do a great deal by putting into execution many schemes now under consideration. The most pressing need was for the completion and publication of the town plan for inner Birmingham. The present uncertainty as to street widening and frontage lines was a serious hindrance to freeholders and building owners alike. The Council might proceed with the planning of the new public square at the bottom of Broad-street, and encourage the rebuilding of that street. The scheme for a new thoroughfare across New-street station was a project of the first magnitude, and it was to be hoped would be considered in relation to the remodelling or rebuilding of New-street station, which was at present not only an obstruction but an eyesore. When the Greater Birmingham scheme brought within the city's boundaries certain outlying districts, pledges were given for the provision of sundry local conveniences, such as public baths, libraries, etc. The prosecution of some of these enterprises would not only tend to the embellishment of these localities, but would provide much-needed employment. In the matter of housing, the Council could materially aid the orderly development of new or partly developed districts by inaugurating a building policy having some regard to the amenities of layout and architectural composition. The present type of new house might be economically sound, but left much to be desired in the matter of design. The freeholders could do much to improve the standard of building by relaxing their rigid attitude, and by selling freely to those who desired to build on their own freehold. The prevalent leasehold system was one of the worst causes of poor building in Birmingham. The building owners could do much for the future of the city by taking a wider and more generous view of expenditure on building. Hitherto rent-producing capacity had been almost the only consideration. If we were a nation of shopkeepers, it was surely not necessary that the acquisition of money should dull our senses to all that was fine and noble in our cities.

"CIVIC CONSCIOUSNESS."

The tenth of the series of lectures on Town Planning, given by Mr. William Haywood, F.R.I.B.A., at Birmingham University, was entitled "Civic Consciousness," in the course of which the lecturer said civic consciousness implied a regard for one's town, and a concern for its good order and appearance. Where it existed, public buildings and the general accessories of public life would assume an air of urbane culture proper to life in great towns. Where it was absent—as in most modern industrial cities—the outward character of the community would be that of neglect and disorder; which might be far from representing the actual individual character of its members.

For the best part of a century communities abroad had shown more civic activity than had been exhibited in this country, for reasons which were fairly obvious; nor was it difficult to see that our mood was now changing towards wider interests, many of which depended upon corporate action, and so fostered civic consciousness.

The return to urbanity on their part (they were not always deficient in the expression of public spirit), was parallel with the adoption by other countries of the best fruits of their individualism. The better sort of English home, whether cottage or mansion, had been easily the most appropriate and satisfying architecture in that phase of community life in the world, and to-day the world accepted their ideals of the individual home, and the exclusively residential road, as preferable in most cases to tenement buildings and roads for all purposes.

The tendency of town planning in all countries was to take what was best in the individual contribution of other nations and to engraft it upon local practice, with such adjustments as local conditions might render necessary. The quality in town life abroad of which they stood most in need was that of urbanity, which not only added to the pleasures of existence, but was considered a commercial asset in Germany and America. Dirt, grime and sordid conditions were no longer thought to be a necessary part of industrial efficiency; on the contrary, as the modern welfare movement showed in individual cases, efficiency was found to be at a maximum in pleasant places, which sufficiently explained why commerce in America was the chief force behind civic consciousness. Truly we should profit by following their example.

Royal Institute of British Architects.

The award of the Royal Institute of British Architects prizes and studentships for 1924 will be announced at the general meeting to be held on Monday, January 21, in the meeting-room of the Royal Society, Burlington House, Piccadilly, W. 1. The exhibition of the works submitted will open on Tuesday, January 22, in Gallery No. VI. at the Royal Academy of Arts, Piccadilly, W. 1, and close on Monday, February 4. The exhibition will be open daily free to the public between 10 a.m. and 6 p.m. (Sundays excluded).

OLITICS AND THE BUILDING INDUSTRY.

By JOHN ANGUS.

t was to be expected that a recent article *The Builder* upon Housing and the Labour ty would shock the feelings of those who fer to keep their politics in water-tight partments. In these matters it is well at times to remember the remarks of a nch statesman that the indiscreet words of w politicians did not matter; the opinions he people alone mattered. There is also a xim, much admired a number of years ago, he effect that one ought to aim at learning ething about everything and everything ut something. The individual who pays y a quarter of his income for the "privi-." of being misgoverned considers he has something to say about the building trade. can at least ask for a certain amount of icial detachment from an independent er, when our ideals are being politically loited to the full.

f there is a doubt whether political tters should be considered in a professional technical paper there is no doubt that ny matters relating to buildings are not mpt from criticism simply because they e been taken up by a particular political ty. On the contrary, there is the more d for criticism, and it is almost childish assume that any political party comes into question; it is merely incidental. When become involved as a nation in the respon-lity of building houses we make the prob- a national one, but it still remains an ividual problem for the building industry. agitate for a Government housing scheme ough the Press, and in due course this is owed up with interviews and articles upon Watch the Building Rings," or some other ular scare topic. Consequently, if the eme is wrecked economically, there are nty upon whom the blame can fall: archi-s, builders, workmen, manufacturers, and lding merchants. This is the usual pro-ure in a nutshell; the results we can now ost predict with certainty. If we begin examine the economic flaws, apparently, we in conflict with the idealists, and if we not to discuss the matter we are to assume t all the idealists are in Parliament. This rely proves that it is a misfortune that als should have anything to do with vote-ching.

Many readers are entirely in agreement h the recent article in *The Builder*, and ir regret is not that it discussed a political tter, but that politicians should think it essary to discuss matters relating to the lding trade. Most people are convinced t civilisation does alter, and almost always the better. But it alters so slowly that man lives long enough to witness in his e such fundamental changes as are popularly conceived. Everyone agrees with the insistent cry for reform, but the remedies can only be obtained in a constitutional manner. If it sounds reactionary, a moment's thought would make it clear that there is a world of difference between legislation which secures better conditions and legislation which gives the actual thing plus the better conditions.

The political method of dealing with housing is an excellent example indicating that the end is less important than the means.

1. It is fairly certain that the question of better housing has all along been mixed up with the idea that this could only be obtained by providing houses out of public funds.

2. It is obvious that better housing conditions could be secured through legislation and by-laws.

3. In attempting to supply the worker with a house out of public funds, we are innocently assuming that a burden is being taken from him, whereas there is a distinct probability that he is paying indirectly.

4. We do not know where the border line is to be drawn between those who are to receive and those who *must* provide their own houses.

5. Are we not encouraging the individual to avoid the responsibility for providing a house?

6. What steps have been taken to grant the individual who is willing to build his own house the facilities and privileges he would expect to find in a communal form in any Government housing scheme?

It would seem that our ideals in housing are evidently confined to the political object of trying to secure something (apparently) for nothing. As citizens these matters concern us politically, but they remain problems for architects and builders. The building industry does not depend for its prosperity upon building for its own requirements; it depends upon a country which is prospering upon a sound economic basis. The seamy side of politics sounds an engaging theme for mordant wit if it would serve any useful purpose, but it is well to bear in mind the statement that "to be described as moderate in politics is almost as devastating as to be described as worthy in conduct." The capitalist (whoever he may be) invariably comes in for severe treatment, but does anyone with any knowledge of the building trade believe that this elusive fellow was allowed to build defective houses and defy all building by-laws? Is it possible that a certain type of speculative builder is referred to as the capitalist? He certainly knows more about bad housing conditions than anyone, but if the law allowed the maximum number of houses to the acre, what then?

When we come to the idea that houses must be built as a debt of honour to our soldiers then let us get on with them, first defining some period or quantity when we can assume that our honour has been redeemed. By that time we may have recovered from the widespread post-war malady of wanting to force other people to let you do them good without asking their leave. There is a difference between a demand and a sacrifice. It is curious that we should cover the country and fill our churches with war memorials as tributes, and have to legislate ourselves into making further sacrifices to provide memorials which shall be useful. Let us have the decency at all events to remember that the operation of the Rent Acts ensured a sacrifice from landlords, which, as a contribution towards this debt of honour, must have amounted to many millions. There is a touch of bitter irony in the fact that their contribution automatically prevented houses being built. And we would rather have had the houses.

The question of the capital levy may be said to be a political question, but it is a very vital matter for architects and the building trade. This is not the occasion for a full discussion of the principles of a capital levy, but this much can be said with safety, that very little study is necessary to convince anyone of the utterly unworkable nature of the problem. It must be obvious to every architect that *real* property represents a tangible form of capital, ripe for the tax-gatherer. To estimate the value of a man's property must involve a certain amount of guessing, and guessing will become a fine art. Building property will present as little difficulty as railway debentures, and the hiding of capital will also become a fine art. It is idle to say that the capital levy will not affect property when we know that securities can be realised and transferred abroad if there is any likelihood of the measure coming forward. Everyone may not escape the tax, but the mere fact that they will try represents as hopeless a condition for architecture as could well be imagined. From beginning to end, the subject of building is gradually being surrounded by legal and economic difficulties which go a long way to confirm the old maxim about the fools who build. In short, the capital levy is a tax on those who possess, and it is tolerably certain that in making a choice of visible possessions the building trade must pay a heavy toll. Altogether it is merely childish to believe we shall be any better off if we pretend to pay off a debt by realising our capital and paying ourselves back again. Every thinking person favours the idea that it is not a bad thing to have a large National Debt. It prevents any nation borrowing more and, as Mr. Strachey says, "the less Governments borrow, whether in war or peace, the better."

Although the business transactions of the Government were fantastic in their wastefulness, the layman notes the curious fact that the Labour Party, generally, seems to be partial to various forms of State control. Past experience proves that the architect and builder cease to exist, as individualists, under any system of trusts or combines. They do their own work with their own staffs, and if opinions differ about the economical side of the arrangement, the absence of efficiency and health due to lack of competition leaves no one in any doubt.

These are merely a few ideas which come to mind in thinking over the relation of politics to the building trade. *The Builder* is to be congratulated upon taking up an independent attitude on behalf of those connected with the building industry, and it is to be hoped it will continue to do so without prejudice to anyone's political or party beliefs. Mr. Arnold Bennett, in his illuminating way, tells us that "Intellectual independence involves ideas about things, and individual ideas cannot be obtained without study and reflection. Conversely, study and reflection are bound to result in intellectual independence."

ILLUSTRATIONS.

Auckland War Memorial.

We illustrate this week a design by Mr. A. G. R. Mackenzie, F.R.I.B.A., for the Auckland War Memorial and Museum.

Municipal Offices, Colombo.

The design for new Municipal Offices at Colombo, placed second in the recent competition, is by Mr. W. H. Bourne, F.R.I.B.A.

St. Bride's Church, Fleet-street.

This well-known church was designed by Sir Christopher Wren after the destruction of the ancient fabric by the Great Fire of London. It was completed about the year 1680, and additionally embellished in 1699. Since that time it has undergone several repairs, occasioned by having been struck by lightning. The uncommon skill of the architect in devising the means of obtaining so lofty an altitude by the use of so few materials will be best appreciated by referring to the section. The spire is lightened in all its stories by arched openings. The cone that surmounts the belfry in the upper part of the tower was most judiciously conceived, for the purpose of forming a base for the spire to spring from, of greater strength than could otherwise have been produced, and in order to give additional security the stone piers in every story are connected by gunmetal octagonal frames extending horizontally, these features occurring from about the height of the capitals of the pilasters. A unique opportunity for making a measured drawing of the church occurred at the last restoration (1901–2), when the spire was taken down and rebuilt entirely. It was possible to measure every stone (the majority of which had the mason's name cut out on the bed), and, consequently, the illustration shows a spire 232 ft. high to the top of the weather-vane, every part of which is a measured drawing. Referring to the elevation, which conveys an accurate idea of the design and proportions of this spire, the base of the tower is carried up square and crowned by a cornice; this supports a stylobate, or continued plinth, which sustains a cubicle story of the Corinthian order (enclosing the belfry), having a large latticed window on each side, flanked by pilasters and columns; these are covered by circular-headed pediments, a blocking course, and a balustrade. At the angles of the latter are ornamental vases of good proportions, which considerably improve the general effect. Within the balustrade is a circular plinth, forming the basement of the spire, which consists of a series of four stories of different orders, the two lowermost being Tuscan, the third Ionic, and the fourth Composite, or Roman, and from the balls in the surmounting basement the obelisk springs that terminates this fine example of architectural science. A. WILLIAMSON, Lic.R.I.B.A.

Tenterden Housing Schemes.

We illustrate in this issue the housing schemes of the Tenterden Rural District and the Borough of Tenterden, Kent.

The Tenterden Rural District Council has completed 74 houses in all, distributed as follows:—Rolvenden (The Layne), Rolvenden (Poplars Farm), Newenden, Biddenden (Charity Field), Biddenden (Standen), Biddenden (Cotlane), High Halden (Durrant Green), High Halden (Ransley Farm), Woodchurch, Kennardington, Stone-cum-Ebony, Wittersham, Appledore. The contractors were Messrs. D. Godden & Son, Ham-street, Ashford; Mr. W. P. Woodgate, High Halden; Messrs. W. H. Bourne & Son, Woodchurch; and Mr. Lewis Edwards, Hawkhurst.

The Tenterden Borough Council's preliminary schemes comprised 40 houses, 16 of which have not yet been built.

The intention of the Council's was to have an equal number of parlour and non-parlour houses, but the Ministry advised that the parlour type of houses should be omitted in the Rural District. The architect provided many distinct designs in order that there should not be an undesirable amount of repetition in this delightful district of Kent. Further variations were obtained by tile-hanging the upper story and gables of some houses, by finishing some of the exteriors with facing bricks and others with roughcast, and by varying the design of chimney-stacks throughout the whole scheme. Local bricks and tiles of rich colour and texture are used. The various builders employed co-operated in every way, one even obtaining old tiles to cover the roofs of some of the houses.

The architect for both the Rural District and the Borough schemes was Mr. George Hornblower, F.R.I.B.A., of 2, Devonshire-terrace, Portland-place, W.

Mountsorrel War Memorial.

The Mountsorrel war memorial is about to be erected on the Castle Hill, Mountsorrel, Leicestershire, in memory of the Mountsorrel men who fell in the war. The memorial is to be built in granite from the Mountsorrel Granite Co., whose works adjoin the site. The sketch on p. 986 shows the interesting old Butter Market House in the foreground, and gives an idea of the proposed site. Messrs. Stockdale Harrison & Sons, of Leicester, are the architects.

Alterations to Premises for the National Deposit Friendly Society, Croydon.

Considerable alterations have been carried out under the direction of the architects, Messrs. Rees & Archer-Betham, of Croydon, at the newly-acquired premises for the National Deposit Friendly Society. Practically the whole of the interior walls to the ground floor have been removed, thus providing large general office space. A large Secretary's room has been arranged, with access to the side entrance, which leads upstairs to offices let out to various firms. These have been so arranged that the whole of the upper portion of the building can be taken over later by the Society without further alteration. The interior woodwork, screens, &c., were carried out in Columbian pine, stained to a walnut colour and polished, and the entrance doors and fanlight in oiled oak. The illustrations show plans before and after reconstruction, and a working drawing of the architects' design for the altered front.

The heating and sanitary goods were supplied by Messrs. Moorwoods, Ltd.; constructional steelwork by Messrs. Smith, Walker & Co., Ltd. ironmongery by Messrs. Carter & Aynsley, Lt The general contractors were Messrs. Lewi Helby & Tanner, of Croydon.

House at Croydon.

This house is to be built of brick with cemen stucco finish, with red pantiles to the ro Dressings are of red sand-faced bricks. T contract price is £1,150. The architects a Messrs. F. W. Rees, M.S.A., and A. Arche Betham, A.R.I.B.A., of Croydon.

House at Westerham.

This house, when built, will stand with co manding views of the Pilgrims Way. Embodi in the planning are several wishes of the own There will be no cornices and all skirtings are be coved, similar to hospital work. T exterior is in red sand-face bricks with dressin of black bricks; red Broseley tiling to the roo metal casements to all windows; red quar tiles to all window sills, lavatories, &c. T contract price is £3,000.

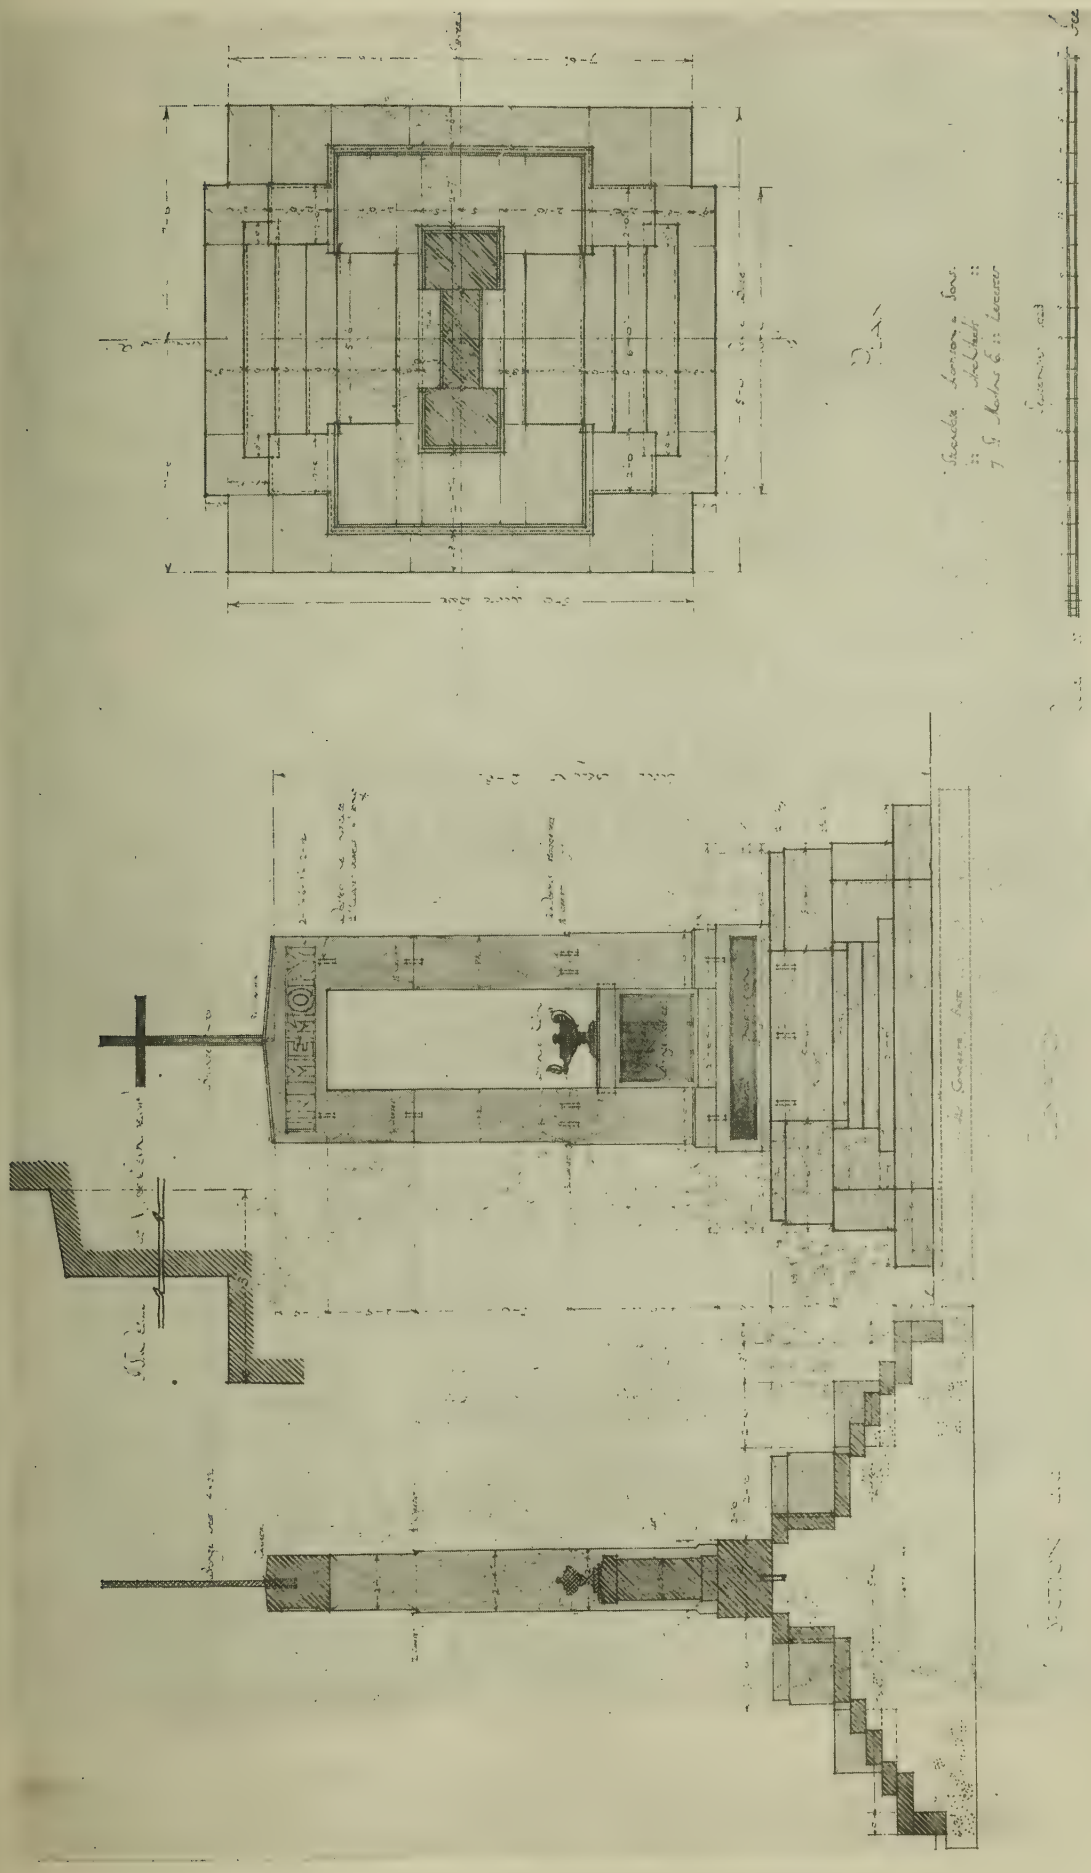
The architects are Messrs. F. W. Rees, M.S. and A. Archer-Betham, A.R.I.B.A., of 44, Par lane, Croydon.

House at Horley.

This house is to be built of brick, with stuc finish left rough from the float, and with bri dressings in purple-brown sand-faced bric The tiles will be green-tinted Broseley. T architects are Messrs. Rees and Archer-Betha The price of this house works out at abo £1,150. The builders are Messrs. Lewis, Hel & Tanner, of Croydon.

New Premises, Newgate Street.

The block of business premises for Mess Horne Brothers, illustrated on p. 1009, has j been completed at the corner of Newga street and Panyer-alley. During the whole the operations, Messrs. Horne's old premi were retained and kept open for the publ



The new building is practically of steel c struction with Portland stone face, and co prises sub-basement, basement, ground, a five upper floors. On the basement floor, addition to showrooms, a large hair-dressi saloon is provided. The ground floor has be planned for island windows and arcades, a the supports to the building above reduced a minimum, the spaces between the stanchic in one case being 40 ft. The design of the bui ing is in the style of the later English Rena sance, and as originally proposed was one sto higher, but was seriously restricted by the rig of adjoining owners, the building being reduc one story and stepped and sloped back on t east side owing to the narrowness of Pany alley.

The architects are Messrs. G. Regin Farrow, F.R.I.B.A., and Sydney R. Turner, Amberley House, Norfolk-street, Strand, conjunction with Mr. S. N. Tacon, head Messrs. Horne Brothers' architectural depa ment, who was responsible for the designing a planning of the shop fittings. The contract were Messrs. Higgs & Hill, Ltd. The ste work was carried out by Messrs. Dawnay & So

Proposed New Edinburgh Art Gallery.

At the opening of the Society of Scotti Artists' Exhibition it was suggested th Huntley House, an historical building in t Canongate of Edinburgh, should be convert into a municipal art gallery.

Lord Provost Sleigh declared the exhibiti open, and said although they had not come any definite decision as to what they would with it, they were awaiting a report from leading architect, and he had no doubt that so advised they would give careful considerati to the suggestion made.

READING SOCIETY OF ARCHITECTS.

"THE RENAISSANCE AND MODERN POINT OF VIEW."

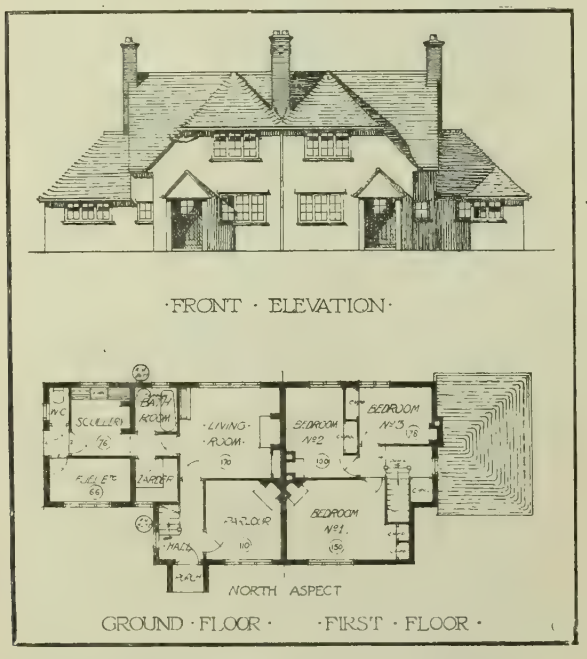
THE fourth and concluding lecture on architecture, arranged by the Reading Society of Architects in conjunction with the Workers' Educational Association, was given at University College, Reading, recently. The chair was taken by Mr. W. M. Childs, M.A., the Principal of University College, Reading. The lecture, which was on "The Renaissance and Modern Point of View," was illustrated by numerous lantern slides. The lecturer, Mr. W. E. Vernon Crompton, F.R.I.B.A., before proceeding with the consideration of the Renaissance and modern point of view, when applied to architecture, drew attention to three points which must be borne in mind.

First, it was to Greece and Greco-Roman thought that we must look for a true conception of the nature of architecture, as an activity, in which order and beauty were the chief values.

Second, that architecture was fundamentally the expression of an attitude of mind, and consequently was the best example of man's activity that was available whereby the value of civilisation might be tested.

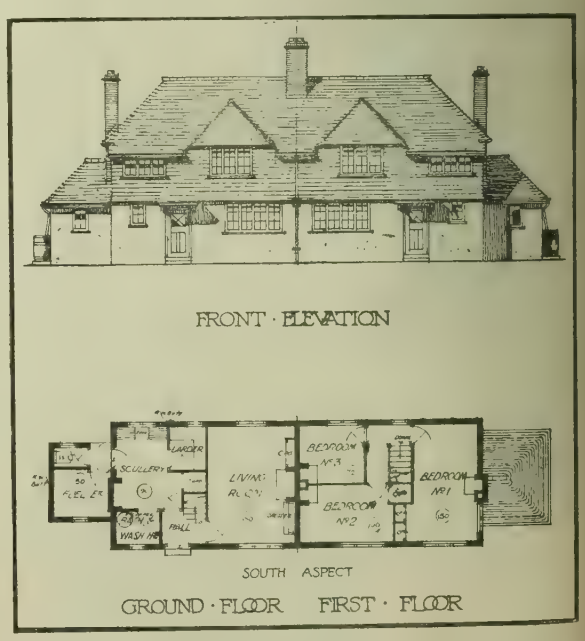
Third, the lecturer proceeded to inquire how it came about that the style of architecture previous to the Renaissance, which they called Gothic, was displaced with such apparent ease, the change they witnessed from Gothic to Renaissance being more of the nature of a break than an evolution, the reason being that the Mediæval scheme of thought was intentionally incomplete. During the Middle Ages certain avenues of thought were forbidden; there was consequently no joy in the untrammelled pursuit of knowledge as an end in itself; such an attitude towards life contained the elements of decay. Further, they must remember that there existed an enormous mass of ancient learning which only awaited discovery: it was the task of the Middle Ages to resume this heritage of knowledge, and in so doing it absorbed that which was eventually to blossom as the Renaissance. The lecturer, with the help of slides of various buildings in Italy, France and England, proceeded to consider the Renaissance point of view with its scheme of values, laying particular stress upon those humanistic qualities of order, reticence, and fastidiousness as to the form and shape of things, which were so prized by the masters of the Renaissance. As Renaissance architecture developed, it became more and more an aristocratic expression, especially in France; a strong tradition was formed in methods of design and technique centralised in the French Academy founded under Richelieu, and later organised by Colbert in the reign of Louis XIV, for the purpose of bringing art into line with the other activities of an aristocratic civilisation, so that it might redound to the stability and credit of the State. He then showed how the principles of architectural town planning which had been evolved by the later Greco-Roman civilisation, but lost during the Dark Ages, were resumed and developed during the Renaissance. The modern point of view might be dated from the decline of the political aristocracy in France and England, and the rise of the new ignorance under which the Renaissance spirit decayed. They then found the ancient activity of building dividing itself quite illogically into two, architecture and engineering, the former being practised somewhat in the manner of a mystery or cult, because it was not understood by the people at large, as it was understood by them during the Renaissance; the latter being purely utilitarian and cut off from the classic humanism of antiquity and the Renaissance, from the beauty of life and the higher spiritual values. This, together with the rise of the Romantic movement in England and France, was the chief influence which accounted for the anomaly in the modern point of view as regarded architecture. A fresh synthesis, based mainly upon the scale of humanistic values of the Renaissance, must prevail among the people generally before a great and consistent school of architecture could rearise in this country.

At the close of the lecture, the Chairman proposed a very hearty vote of thanks to the lecturer, and expressed the hope that the Reading Society of Architects would arrange other similar lectures, as they were invaluable in educating the public in architecture. The need for such education was apparent when the heterogeneous buildings now being erected throughout the country were considered. Everywhere shoddy and unlovely buildings were springing up, and only occasionally was there any evidence of good architectural taste.



THEATRES AND TOMBS.

Sir Banister Fletcher, at the Central School of Arts and Crafts, in the last of his lectures before Christmas on this subject, on December 19, described various public buildings which played their part in the social life of Athens. Theatres, stadia, agorae, propylaea, and town gates, all helped to reconstruct the daily life of people who went in and out of the town gates, did their business and gossiped in the arcaded agorae, frequented theatres, attended foot races in the stadia, or passed through the propylaea to the temples. These propylaea of massive columns were an evidence the Athenian desired to dignify the approach to the dwelling of the virgin goddess. Through this portico all free-born Athenians must have passed for the religious Panathenaic festival, just as villagers of Oberammergau joined in the Passion Play. Theatres were everywhere; both in the homeland and in the colonies; for drama, religious in origin, was woven into the life of a nation that gave birth to the great fathers of the drama. Greek theatres were not closed up and badly ventilated, but were open to the sky and air, and thus were suited to a race that valued physical fitness above all earthly possessions. The lecturer referred in detail to the typical Theatre of Dionysos, hollowed out of the side of the Acropolis and within the sacred enclosure of the Temple of Dionysos, to which it was connected by beautiful colonnades. There was the central circle of the orchestra, where the chorus danced and chanted the plot; while the few actors spoke their parts from the long straight "logeion" in front of the "skene," and the populace occupied the rising tiers of circling seats. Then there was the great Stadion of Athens in a valley between two hills, which gave long lines of seats for 40,000 spectators. Begun 331 B.C., it was finished by Herodes Atticus, and was now again restored for the revived Olympian games.



The lectures recommence after Christmas with "Ancient Roman Architecture," the first lecture being on January 16, at 6 p.m., at the Central School of Arts and Crafts.

The Architectural Association.

Miss Isabel Chambers, of the Architectural Association, has been awarded a scholarship for study of architecture in Rome.

BOOK REVIEW.

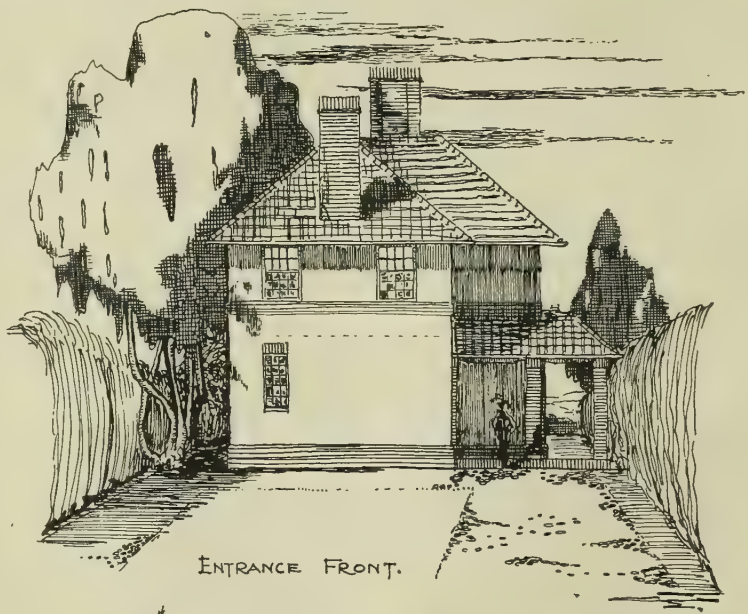
ome and Country Arts. By W. R. LETHABY. (London: 26, Eccleston-street, S.W. 1.) Price, 1s.

Professor Lethaby's interesting account of ıe decay and attempted revival of Home and ountry Arts provides much food for thought. hose of us who are old enough to remember ıe general use of hand implements, the flail, ıe sickle and the scythe in English agriculture ay be excused a sentimental clinging to the d time associations that are being swept away machinery, but it must be admitted, whether e like it or not, the machine, once invented, erts a fascination over its human creators d fellow-workers. It extorts from mankind terrible price for its services in rendering dully echanical some at least of those who are sociated with it. Even the noble mechanisms antiquity were not exempt from this law, and en have been worked to death in exquisite ecian galleys or tortured with privation and sease in the confined fo'castles of beautiful iling ships centuries before the special machines at enrich our present-day manufacturers were wn as ore from their respective mines. It ay ultimately come to be recognised that the ly machines which are really beneficial to ankind as a whole are those which, like ueducts or drainage systems, direct the eat force of gravitation without demanding m man more than a reasonable amount of sistance and supervision; but we are not yet ing in an age that recognises any such thing. Against the tendency of the machine to en- ve the man, Professor Lethaby sets up the eal of voluntary happy work of individuals their own homes, or in village clubs, insti- tes and common workshops, where men might themselves make some of the things ey needed—simple furniture, household mend- gs, and the like . . . . Delight in doing and aking will one day have to be refounded in me such scheme of voluntary *recreative* work. present, all the solid forces are against it. ır custom of production for money profit a machine owner is radically opposed to any ethods of producing useful work purely for e joy of making—and what would the cinemas if the people could amuse themselves without ying for machine acting from America?"

Professor Lethaby pays tribute to the excel- nt work done by the women's institutes, and any real return to the practice of Home Art to be made it can only come about by per- ssion and encouragement of the women- lk. The description of the Northumberland mily seated about the fire and carving wooden wls, and the like, will seem delightful to ay-at-home readers whose hair has already a od dash of grey in it, but may not commend elf so highly to the dole fed young men and gh-heeled young ladies to whom its lesson ould do so much good.

xamples of Modern Architecture. (Ed. J. Burrow & Co. Ltd., Cheltenham.) Price 2s. net.

We welcome any publication having as its ject the advancement of architecture and the miliarising of the general public with its best hievements, particularly its best modern hievements, for the older buildings receive r the most part their quota of consideration, hile contemporary works are often ignored. nd no Art can thrive under neglect. This tle series deals for the most part with ork in the west of England. Mr. C. F. W. ening has a reputation which extends beyond s county, although most of the work illus- ated has been carried out in the neighbourhood Bristol. There is a delightful interior of a use at Abbots Leigh, a charming little cottage Portishead, and an elegant shop-front at ifton. Another volume deals with the work Messrs. Stockdale & Shirly Harrison at icester. There are some views of a fine eorgian-looking house and some interesting rehouses and offices. The volume devoted the work of Mr. L. W. Barnard covers a wider ld, and takes in a cottage at Lalk Bay, Cape Colony, a church at Wrexham, and various war memorials. We look forward to the extension of this admirable little series.



Chats on Old English Drawings. By RANDALL DAVIES, F.S.A. (London: T. Fisher Unwin.) Price 9s. net.

It is pleasant and instructive to read this interesting addition to the well-known "Chats" series. The subject of this volume will appeal to many of our readers, especially architects, who have a taste for acquiring drawings of the character dealt with by the author. It is well that these studies survive, and are still occasionally to be met with by the diligent collector. Their acquisition undoubtedly brings considerably more pleasure to the man with more taste than money, than to the millionaire with more money than taste, his long purse enabling the latter to acquire whatever he may desire without the pleasure of the search. Mr. Davies considers the period of the four Georges, finishing at 1820, a suitable one for this book, but unfortunately this excludes many notable men. There is, however, a possibility of another volume dealing with drawings of the Victorian period, which, to quote Mr. Davies, "might be stretched a little to dovetail in the end of this one." This would embrace those omitted. The eight chapters, preceded by an entertaining introduction, deal with the various branches of drawing, each illustrated with excellent examples from the author's collection. Other examples are from the British Museum. The frontispiece in colour is a charming example of Rowlandson's work, entitled "The Cottage Door," a typical rural English scene. The volume will be readily welcomed, and set the lover of beautiful drawings again afield to rescue, enjoy, and preserve some examples from the pen or pencil of a dead master.

THE ROAD*

By W. R. DAVIDGE.

As Mr. Belloc well says in this book: "We have come to a crisis to-day in the history of the English road. It must be changed—or supplemented—under peril of such congestion as will strangle travel and interchange: that is the interest of the subject to-day." There is no doubt about it. A complete new main road system is, or will shortly be, required throughout the length and breadth of the country. There has been nothing like it since the coming of the steam locomotive forced the construction of railways, with their specialised tracks, and railway embankments and cuttings began to cut up and gash the countryside. The difference, and the only difference, is that the motor on a road surface can tackle gradients impossible for the steam locomotive and its heavy train of vehicles. The choice, and the only choice, is whether we shall in the near future widen all our present highways and alter our whole countryside, or set to work on a complete new system. The latter is by far the most preferable; we cannot spare our pleasant country lanes and the high streets of our smaller towns; and the main streets of our villages will be much too costly to widen.

At present all the new roads that are in process of making will but gather the traffic, and concentrate it into still further bottlenecks in the congested streets of our country towns, or lead it into one or the other of the narrow bridges and narrow streets of such towns as Dartford and Rochester. Much good work has been done by the Ministry of Transport, but it is next to nothing compared with what yet remains to be done. "We are arrived at a chief turning-point in the history of the English highway. New instruments of locomotion, a greater volume of traffic, a greater weight in loads, and vastly increased rapidity in road travel have between them brought us to an issue: either some very considerable and immediate change in the character of the road, or a serious and increasing handicap in our rivalry with other nations through the strain and expense of a worn-out system." Mr. Belloc traces the history of the British trackway from its earliest beginnings. We see how powerful an influence is the soil on which the track lies. Even in those early days the first essential was a dry and well-drained trackway to afford hard going, hence the early British tracks kept almost entirely to the high grounds and the chalk downs. In Roman days the same tracks were in many cases followed, but with the directness of line, irrespective of gradient, which marks the military character of the Roman road. The Roman road is the true and only root of the road system of Britain. When forced marches had to be undertaken it was essential that the distances should be reduced to the minimum, and in the practical absence of wheeled traffic there was no restriction as to gradient, hence the steady and relentless line of the Roman road.

The influence of marshland in deflecting the line of roads is, however, abundantly clear, and in many cases the absence or loss of a portion of the Roman road is due to the original causeway having disappeared in the marshes. Mr. Belloc makes great play with the influence of the marshes on many of the great events in history, and claims that the Russian Orthodox Church and the last Revolution would neither have been, save for the Pinsk marshes. Certain it is that London would never have been where it is but for the marshes that existed elsewhere along the lower Thames.

The modification due to the availability or otherwise of road-making material has also had tremendous influence on the character of the road; for instance, the absence of main roads through the Fens for centuries was not only due to the necessity of maintaining embankments and bridges, but rather from the almost entire absence of hard material.

In dealing with the political influences which have shaped the position and direction of our roads, Mr. Belloc is decidedly in his best vein, and particularly in the scathing scorn which he casts on the vested interests, which are "strangling the communications" in the old age of a wealthy State from the very effect of its wealth. It is a paradox which occurs over and over again in the history of great mercantile cities: their wealth—which should be their greatest help in developing and changing communication—crystallises them. Their ways are laid out for a particular phase of traffic. The land on each side of the streets becomes enormously valuable. The traffic changes in character. New ways are demanded, but they are not built because the compensation required terrifies the reformer. There follows inevitably heavy congestion, and then, if nothing is done, a succeeding phase of decay. According to Mr. Belloc, "the general rule in history is that a city, having reached its highest point of wealth, becomes congested, refuses to ac its only remedy, and passes on from co tion to decay." The main motive is a blu in the science of economics. It is the that the destruction of a number of imagi economic values ("imaginary" because form no part of the total real wealth of State)—to wit, the urban site values—i some way an expenditure of real wealth. far is this from being the case that there perhaps, no example in all history of a gested street system being reformed wit the wealth of the city increasing after change.

The lack of legal powers and the cumb process of obtaining those powers has much to paralyse the hands of the authorities. For centuries in England t was no compulsory power in the hands public authority for the making of a new r and such powers are a comparatively mod development. A road could not be altere even widened, the only compulsory pow being those to secure a levy of labour money for the repair of the highw Nothing in the nature of a general plan, instance, of lateral or coast roads to link the ports has up to the present been feasib

The local system on which English ro have developed has made the roads for most part parochial in character and di tion, though far more picturesque, as trasted with the national system of di routes which is a feature of, for instance, French provinces.

A national road system is an essential n of the present day, and by halting and h tating steps we must inevitably come to c plete and full recognition of this fact. nation is now beginning to take the roads hand, and what has been done so far is the commencement of far greater things to come. A complete new road system necessary.

* "The Road," by Hilaire Belloc. (Published by Charles W. Hobson, for the British Reinforced Concrete Engineering Co., Ltd.) Price 15s.

Academic Dress "Skit," Newcastle-upon-Tyne.

NORTHERN ARCHITECTURAL ASSOCIATION

On December 12, the Northern Architectu Association held their annual dinner at Ne castle-upon-Tyne.

Immediately the guests were seated th arrived an unexpected "deputation" of architects in academic garb, all grotesqu gowned and strangely visaged. The deput tion proceeded to submit a skit upon the rece proposal that architects should adopt acade dress. Included were a president, a fellow, associate, a student and a probationer, a they announced their arrival to the strains "D'ye ken John Peel," by singing:

"We have summoned this meeting here to-d
To show you architects grave and gay,
Who have left their drawing-boards far, f
away,
And we don't care a —— till the morning."

Each in turn gave his own particular versi of the class he represented.

Upon taking their seats the "President was called upon to give his "inaugur address," the character of which can be inferre from the opening remarks:—"Ladies an Gentlemen,—It falls to my unhappy lot a your Deputy Acting Assistant President, ele and select, but without portfolio, to commenc my term of office for the next three hundre and sixty-five minutes by delivering you m inaugural address."

They concluded with their hymn of prais (sung to the tune of "The Church's one Founda tion"). The final chorus was:

We are the builder's bugbear,
For architects are we;
Nobody ever knew us
Without our lingerie.
But since we've put our gowns on
All people now do say,
"Hoch, hoch, mein Gott,
What a jolly posh lot,
Are the architects to-day."

TOWN-PLANNING INSTITUTE.

IR. G. L. PEPLER took the chair at the meeting of the Town-Planning Institute, en Mr. E. R. Abbott opened a discussion " Streets."

IR. ABBOTT said that the word " street " in ordinary acceptation of the term usually lied a roadway more or less built up on er side. This, however, was not by any ns what was meant by " streets " under n-planning schemes. For the purpose of Ruislip-Northwood Town-Planning Scheme definition of " street " in section 4 of the lic Health Act, 1875, was adopted, and as follows:—" Street " includes any high- and any public bridge (not being a nty bridge), and any road, lane, footway, are, court, alley or passage, whether a roughfare or not. The model clauses did , in fact, define a " street," but the struc- e of the clauses did not appear to require h definition, as would be seen later on. It s quite impossible within the limits of one er to refer in detail to the whole of the lel clauses relating to streets, and it was, refore, necessary to confine themselves ner to the principles upon which they had n drafted. Among the definitions perhaps most important to consider was that of standard street," which meant a street structed in accordance with the by-laws in accordance with " such a specification would ordinarily be required by the Council a condition of declaring it to be a highway airable by the inhabitants at large."

ome sets of by-laws prescribed only widths carriage ways, levels, etc., but did not in way define the actual method of con- ction or the materials to be used, and pre- ably the words in inverted commas had n inserted to meet this. It was under- d that the reason for the omission of a ification of materials in the by-laws had n in order to avoid the obligation of the ncil to take over the streets when con- cted in accordance with a specification con- ed in by-laws under Section 20 of the rate Street Works Act, 1892, and thus w upon the Council all the expenses of ping the street in repair during, and per- s entirely re-making it after, building rations had been completed. Quite frankly had grave doubts whether the attempt to a "standard street " under a scheme would satisfactory because what would have been standard street," say, ten years ago would ridiculous in these days, and for all they w in another ten years' time their existing dard would be entirely out of date.

n the two most important cases where the cession " standard street " was mentioned e was an appeal in the first case to ices and in the second to the Minister. re these tribunals to accept the Council's rmination as to what was a " standard et " or were they to go into various speci- ions used from time to time by the ncil? Many Councils had not put in force Private Street Works Act since the war, what was a " standard street " in their s?

ersonally, he thought it would have been erable to leave it to the Council to appor- the cost of the street to be paid for by the ers with the appeals to the justices or he Minister as the case might be. With rd to the construction of new streets, it ld be recollected that under the earlier mes the methods of laying out and con- ction and widening of streets were set out ewhat in detail. The method adopted er the model clauses was to apply the pro- ns of the Private Street Works Act, 1892, he Public Health Act, 1875, section 150, ne making of new streets under a scheme. re was one outstanding feature in the el clauses which was, in his judgment, a t improvement upon clause 4 of the slip-Northwood scheme, which was as follows:—" The following new streets shall be constructed under and in accordance with this scheme and on the lines and of the width indicated on the map, that is to say, the streets or footways numbered 1.....83 and coloured pink on the map."

Although this clause stated that the streets " *shall* be constructed " there was no obligation upon the Council or the owners of the land to construct them, and it was, therefore, somewhat ambiguous, although there were powers enabling the Council to construct any of the streets shown on the map.

The model clause No. 6 stated that the purposes of the scheme should include the execution of street works upon certain lands coloured pink on the map; these lands might include not only lands upon which new streets were to be constructed, but also lands adjoining existing streets which were required for widening. This undoubtedly simplified the procedure, although the model clauses were thereby made somewhat involved.

The earlier schemes immediately upon approval definitely appropriated the lands upon which streets were shown to be constructed as " streets," and the local authority had no power to permit buildings of any kind thereon. The model clause 9 authorised the Council to permit buildings temporary or otherwise upon the lands upon terms pending the construction of the new streets. It seemed very doubtful whether such an authority was desirable, and in view of the new developments in road construction by the Minister of Transport and County Councils it might create difficulties, the Council (borough, urban, or rural) being the only body who could give or withhold consent.

There were now three types of streets with which framers of town schemes were concerned, viz., (1) Arterial roads, (2) main thoroughfares, (3) estate streets. No town-planning scheme could ignore the possibility of the first type having to be constructed, and when one realised the enormous expense in which the country was at present involved, owing to these roads being constructed in a hurry for the purpose of the relief of unemployment, it behoved them to see that ample provision was made in all schemes for securing the sites of such roads and taking powers which would enable them to be made without the expense involved in the actual purchase of the land, because although the compensation or purchase money might be about the same the expenses of purchase were certainly very much greater.

The model clause 6 contemplated the marking on the map of the sites of proposed arterial roads and main thoroughfares, and gave the Council power to declare such site to be (*a*) in the case of a street to be constructed wholly at the public's expense a " highway repairable by the inhabitants at large," in which case no expense (otherwise than by agreement) could be recovered from landowners, or (*b*) declare the site to be a private street, when the Council could put in force the provisions of the Private Street Works Act, enter on the land, construct the street, and recover the whole cost (1) if it be a " standard street " from the frontagers, or (2) if it be a street involving cost beyond that of a " standard street " such portion as represented the cost of a "standard street." The cases in which the site of the street would be declared to be a highway repairable by the inhabitants at large would probably be very few in number as it could very rarely be contended that the new street (even if it be an arterial road) would not be of benefit to adjoining owners. In connection with streets under (*b*) provision was made by the model clause 12 (2) whereby, with the consent of the Council, the street might be constructed in advance of the remainder of the street of a less width than was required by the by-laws.

The model clause No. 12 provided in the first schedule for the laying out of narrow streets for residential areas much on the same lines as the earlier town-planning schemes, and the first schedule specified various types of such streets. There were also provisions whereby landowners would not be charged with the cost of construction of new streets so long as their land was rated as agricultural land, and they would not during that period have to pay interest on the moneys which they would ultimately have to pay.

There was a very useful model clause, No. 8, enabling the Council to construct sewers under any of the sites or proposed streets before the other street works were carried out, and recover the cost when such other works were completed. It was, perhaps, desirable to refer especially to the provisions as to widening of existing highways contained in model clause 9. If the land adjoining that required for the widening had already had buildings erected upon it, the model clause provided that no part of the cost of the widening should be apportioned on the frontagers. If, however, the land was rated as agricultural land and the highway was only to be widened to by-law width the cost might be apportioned on frontagers whose land was rated as agricultural land on both sides of the road, and for this purpose the existing highway, together with the land required for the widening, was to be deemed to be a private street. The Council would, of course, have to pay for widenings beyond by-law width. This seemed to be an improvement upon the Ruislip-Northwood scheme, where in such a case the frontager was not only required to give up the land, but was relieved from all the cost of the street works.

Model clause 11 placed an obligation upon the Council when a plan for a new street was submitted to require owners of land, which in their opinion would be affected by the construction of the new street, to submit plans and particulars of the development of such lands. The clause in the Ruislip-Northwood scheme left it optional to the Council to require such particulars. Neither clause was satisfactory because there was nothing which obliged the owner of the lands submitting the plan of development to carry it out on the lines indicated in the plan.

There were two model clauses which seriously infringed on the rights of the public, namely: Model clause 13, under which the Council might lay out any part of a public highway as a garden or plant it with grass or trees or shrubs—in fact, they might lay out the whole of it except a few feet, and prevent any vehicle being driven along it. The Ruislip-Northwood scheme provided that the carriage-way or footway should not be reduced to a less width than that required by the scheme or the by-laws, as the case might be. Model clause 15 provided that for the purpose of adjusting the boundary of a street the Council might make an exchange of land forming part of the street for other land without any limitation. The Ruislip-Northwood scheme provided that in no case should the land so given up by the Council exceed in area that given up by the owner. In addition, no agreement for exchange should be entered into until after public notice had been given, and four inhabitant householders were given a right of appeal to the justices.

It was, he thought, a matter of regret that in the case of model clause 16, providing for the diversion or stopping up of highways, the proviso in the Ruislip-Northwood scheme enabling the Council to proceed under the Private Street Works Act in cases where the substituted highway included the whole or part of an ancient public footpath repairable by the inhabitants at large had not been inserted.

MR. F. W. BUCKNER (Tilbury U.D.C.) said the construction of the great arterial roads with interlinking by-pass communication was changing the face of the country, and would, he hoped, go far to simplify some of the pro-

blems which had arisen. In many cases, however, traffic routes were being proposed without any relation to town planning, and this was wrong. If the Ministry of Transport was made a subordinate branch of the Ministry of Health the subject might be considered on a truer basis and grave blunders would be avoided. Considerable objection was now being raised to the narrow width of the roads in the housing areas of many local authorities. He knew that the plea of economy in cost of construction and upkeep was put forward in support of these limited widths, but when the restrictions led to congestion and delay and consequent loss of efficiency the practice was wasteful rather than economical in its final result.

Mr. E. J. Elford (Borough Surveyor, Wandsworth) said the reason why by-laws did not specify streets in any detail was obvious. If a street was made up and then afterwards the gas, water, and sewer pipes were laid it meant opening up probably 40 per cent. of the road, and this involved great waste. He was sorry to see that the making up of streets by the owners was rather encouraged. He did not quite understand the author's objection to a standard street, because he took it that the purpose was to fix a basis on which to charge the owner. The owner would be called on only to pay his proportion for a standard street, and not for something better, which was fair to all parties. The powers given to a local authority to construct sewers would be very useful, because it was found that as soon as a sewer was laid within a reasonable distance land was developed.

Colonel E. B. Martin (Salford) regretted that different schedules had been sent out with the model by-laws and with the by-laws for town-planned areas. He agreed as to the narrowness of the streets on the housing sites, and suggested that they should be careful in their endeavour to cheapen the cost of houses not to transfer the cost to the rates.

Mr. Warwick Draper suggested that in dealing with by-laws they had to bear in mind that the construction of private transport roads might have a considerable bearing on the problem.

Mr. I. C. Gibbon (Ministry of Health) said that in framing the model by-laws the Ministry had to apply the general law of the land. The object of the standard street was to have a basis for charging. It was not the practice of the country under by-laws to set up a standard for road construction, and rightly so, because standards of construction changed. It was the custom for engineers to protest against any attempt to reduce standards with regard to streets, but it was not fair to charge the developer more than was necessary for housing requirements. In proportion as they did that they would increase the difficulties of getting houses.

Mr. Abbott said he had written the paper with a view to discussion, and there would be a further opportunity to discuss it. He quite agreed that it was not fair to place on the house developer the cost of roads constructed for through traffic. If they got down to bedrock they knew they could not get anyone to build houses for the working classes at their own expense.

Builder's Estate.

Mr. Harry Wardle, of Milehouse-lane, Wolstanton, Staffs., builder and contractor, left estate of the gross value of £6,581, with net personality £213.

URBAN AMENITY.

The following is a summary of the ninth the series of lectures on Town Planning given Mr. Wm. Haywood, F.R.I.B.A., at Birmingh University :—

The amenity of town structure was not ea analysed ; and it was difficult to indicate way actually producing this quality of attraction cities.

They agreed that certain towns were pleasa that others were imposing ; and some so u and depressing that they saw them as little possible. Yet the residents of ugly towns little to prevent further unpleasant devel ments, although, if they considered the mat it was chiefly by avoiding preventable uglin that they could best prepare conditions favo able to greater amenity.

Before this negative approach towards amen could be made, however, it would be necessa for communities to think more collectively th at present ; and since collective thought h usually been favourable to everything that ma for urban improvement, the increase of amen in city life became largely a matter of arousi public conscience to an appreciation of environment.

In various ways this change of outlook w now taking place. The Town-Planning Ac which were largely inspired by a desire for grea amenity (although they failed to provide a method for giving it legal assistance), had been helpful indirectly, by stirring people a new knowledge of their surroundings ; a in this new interest—now rapidly extending they would find the opportunity they needed giving to their towns that uplift in outwa expression which so many of them lacked.

The Entrance Lodge, Ickleston Grange, Cambridgeshire.

Major Hubert C. Corlette, O.B.E., F.R.I.B.A., Architect.

LEGAL SECTION.

NOTES ON CURRENT CASES.

Covenants against Underletting.

The case, Terrell *v.* Chatterton, which we ted July 28, 1922, has been carried to the ouse of Lords (1923, A.C. 578), and it is of portance as it relates to sub-letting in breach covenant without consent. The facts were rtly as follows: By an agreement, dated rch 11, 1919, the plaintiff had let to the fendant certain premises for a term of five ars from March 25, 1919, at a yearly rent of 35, and under this agreement it was provided at the tenant should not assign, or underlet, or rt with the possession of the said messuage, premises, or the agreement without the nsent in writing of the landlord for that pur- se first had and obtained, such consent not be unreasonably withheld, and as a condition such consent the landlord might require e assignee to enter into an agreement with him ect to observe and fulfil all the obligations d conditions of the agreement. The agree- nt also contained a power of re-entry on lure on the part of the tenant to observe or rform the conditions contained in the agree- nt. On February 14, 1920, the tenant, h the consent of the landlord, had let the floor for a period of three years, to one yor, but on February 28 of the same year e tenant had, without the knowledge and nsent of the landlord, agreed to let the rest the premises, except the top floor, on a rly tenancy to another tenant.

On discovering the existence of this further b-letting the landlord on July 5, 1920, had itten a letter to his tenant determining her ancy and requiring her to surrender the emises.

The action against her was commenced in tober, 1921, and in the statement of claim, er stating that the first sub-letting of the top or had been made with the landlord's consent, was alleged that the second subletting con- tuted a breach on the defendant's part the agreement and a declaration was asked to that effect, and possession of the premises d mesne profits were claimed as from February 1920.

The Judge in the Court of first instance had d that as the tenant had not sublet the whole use without the consent of the landlord there s no breach of covenant. There are cases the effect that covenants not to sublet are not oken by an underletting of only part of the emises (Church *v.* Brown, 1808, 15 Ves. 258; ove *v.* Portal, 1902, 1 Ch. 727; and Wilson *v.* senthal, 1906, 22 T.L.R. 233); this latter case mentioned in reference to a decision under Rent Acts (*The Builder*, March 26, 1920). the Court of first instance the Judge held at as such covenants must be construed ictly in the absence of the words "or any rt of the premises," the covenant did not ply.

The Court of Appeal had held that, even uming that the covenant did not include assignment or underletting of part of the emises, yet in this case the tenant had, in t, dealt with the whole of the premises and dgment was given for the plaintiff, and the ouse of Lords has now affirmed this judgment the Court of Appeal.

The finding of the House of Lords was that tenant had, in fact, broken the covenant ause she had by the second letting parted h or sublet the whole of the premises, whilst covenant provided that she should not ign, sublet or part with possession of the mises. The House of Lords considered the e very plain since the two transactions, the t with consent, but the second without nsent, resulted in the whole of the premises ng parted possession with, or sublet, but we st point out that this decision does not in way touch the point we have mentioned ve that a covenant not to assign, sublet, or t with premises is not broken if only a part is so assigned or sublet; in fact, it is confirmed, for Lord Wenbury in his judgment puts the matter thus: "It is said, and said with truth, that if there be a covenant not to assign or underlet the premises, it is not a breach to assign or sublet part of the premises." That being the law it is extremely important that those letting their houses should protect themselves against the risk of having part of the premises assigned or underlet without their consent, for in all probability the assignment or subletting of a part would have more objectionable features than the subletting of a part, and the remedy is very simple as is shown by Lord Wrenbury's judgment, for all that is required is that in such covenants the words, "or any part thereof," should be inserted.

Vendor and Purchaser Deposit.

The case Chillingworth *v.* Esche, which we noted in our legal section May 25 last, has been reversed on appeal (*Weekly Notes*, November 10). By a document dated July 10, 1922, the plaintiff agreed to purchase a certain property, subject to a proper contract to be prepared by the vendor's solicitors, and acknowledged having paid a sum of £240 as deposit; the purchaser had signed this document and the vendor had added a receipt for the deposit. The vendor also gave an independent receipt for the deposit and both parties had signed a schedule of trade fixtures "under agreement for sale." The vendor's solicitors had sent a proper formal contract for approval and it had been approved by the purchaser's solicitors, but the purchaser did not sign the engrossment and subsequently declined to proceed with the negotiations, and brought an action for the return of the deposit. As shown in our former note, the Court held the deposit could not be recovered, but this judgment has now been set aside by the Court of Appeal. The Court held that the document of July 10, 1922, was not a concluded agreement, but merely a preliminary document "subject to a proper contract," and the parties were not bound until such a contract was executed, and the deposit must be repaid, and that the other documents relied upon, the schedule, &c., did not affect the important words "subject to a proper contract." It was further contended that the deposit was a guarantee that the purchaser meant business, and that as no business resulted it was forfeited, but the Court held that there was no ground for saying that a purchaser by breaking off negotiations forfeited his deposit. The case is not one where default is made in completion under a definite contract of sale, as, for instance, Hall *v.* Burnell (*The Builder*, October 27, 1911), but in any case the way to avoid litigation was definitely to provide by agreement what is to be done with the deposit.

Workmen's Compensation: Assessment of Compensation.

The decision of the House of Lords in three appeals from the Second Division of the Scotch Court of Session, Portland Colliery Co., Ltd., *v.* Murray; John Watson, Ltd., *v.* Quinn; and William Dixon, Ltd., *v.* Madden (1923, A.C. 566), is of importance as it decides what is the position of men who have been partially disabled by accident and who have been given light work when, owing to a change in the conditions of the labour market, their position is made better or worse.

The facts of these three cases are shortly as follows. In the first case a man employed as a miner had sustained an injury by accident that incapacitated him from following his occupation as a miner. Before the accident his average weekly earnings were £2 7s. He was paid full compensation as totally incapacitated for about fifteen months, and then he was given light work on the surface with partial compensation. Then, owing to a general rise in wages, the man's earnings equalled or exceeded what he earned before the accident and compensation was stopped and the man acquiesced in this.

Then came the coal strike in April, 1921, and all work stopped, and the mine became flooded and the man being unemployed commenced arbitration proceedings to obtain compensation. On April 1, when the coal strike commenced, there was a demand for masons' labourers, and before his accident the man had, in periods of inactivity in the mines, worked as such, but he was incapacitated for that form of employment and was classified as unfit in the list of unemployed at the unemployment bureau.

The Sheriff Substitute in the arbitration proceedings had held that the respondent's failure to obtain employment was due, not to his injury, but to the state of the labour market, and that the man's search for work might have been equally unsuccessful had he been uninjured, but that his condition of partial incapacity materially narrowed his chances of obtaining work and he refused the application for compensation, but as the employers had promised the man light work as soon as it was available he had provisionally fixed the compensation he should receive when he should commence light work at 12s. 6d. The Scotch Court of Session held that compensation should not have been refused and remitted the case for the compensation to be assessed.

In the second case a miner had been injured by accident on May 20, 1914, his average weekly earnings then being £2 4s. He was paid full compensation as totally incapacitated to November 8, 1915. Subsequently under an award, dated January 7, 1917, he was paid 10s. 4d. a week as partially incapacitated, and this was continued until May 25, 1920. After that date the compensation had been stopped because owing to the rise in wages the man at surface work was earning more than his average weekly earnings before the accident. From November 1, 1921, the man, owing to a fall in wages, was earning only about £1 6s. a week, or less than his pre-accident wages, and he requested his employers to renew the payment of compensation, but they refused and applied for a review of the award. On the review the arbitrator held that the employers' liability to pay compensation only ended for the limited period between May 25, 1920, and October 31, 1921, while the man was earning wages in excess of his average weekly earnings before the accident, and an award was made of 9s. a week from October 31, 1921.

The Court of Session had affirmed this award. We may here note one point in connection with the case, for if the whole period from May 25, 1920, to January 23, 1922, the date of the hearing, was regarded, the average earnings of the man would exceed his pre-accident average, and the opinion of the Court of Session was asked whether the whole period should not have been considered, but the Court negatived this suggestion.

We do not propose to state the facts in the third case which closely resembled the circumstances of the second case. An award for partial incapacity had been made but terminated when, owing to a rise in wages, the man was earning more than his pre-accident average, but on review an award had been made when wages fell.

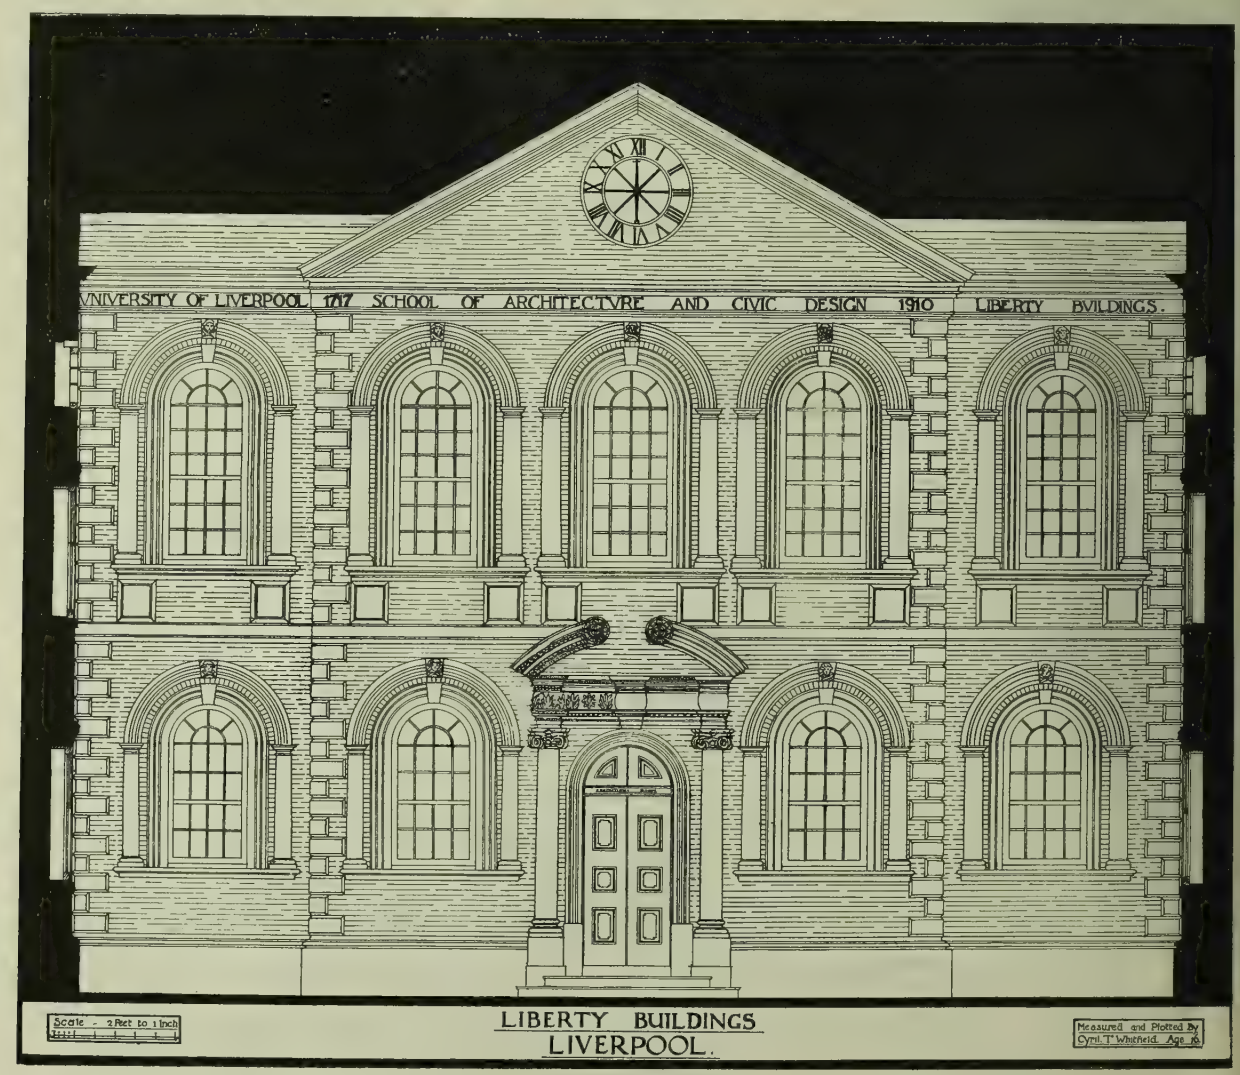
The House of Lords in delivering judgment dealt with the three appeals together, and in each case affirmed the decision of the Scotch Court of Session.

The decision of the House was delivered by Lord Dunedin, and it may assist our readers if in the first place we give his very brief summary of the facts: "These appeals have one common feature. In each of them a workman was injured, and after a period of total incapacity was awarded compensation fixed as for partial incapacity, he being able to earn, and *de facto* earning, a certain amount of wages less than the average pre-accident wage earned when he was an uninjured man. Then came a period of inflated wages due to the war with the result that his *de facto* earnings for light work rose to a

greater figure than his average pre-accident wage. In terms of paragraph 3 of the First Schedule of the Act his right to compensation then became suspended. Wages having fallen his earnings no longer exceeded the average pre-accident wage. His physical condition remained the same and the wages earned by him having fallen below the pre-accident rate the question arises whether he is entitled to partial compensation."

The answer given was then in the affirmative, and the following is briefly the reasoning contained in the judgment. The right of compensation rests not on the Schedule but on the first section of the Act: "If in any employment personal injury by accident arising out of and in the course of the employment is caused to a workman his employer shall, subject as hereinafter mentioned, be liable to pay compensation in accordance with the First Schedule of the Act."

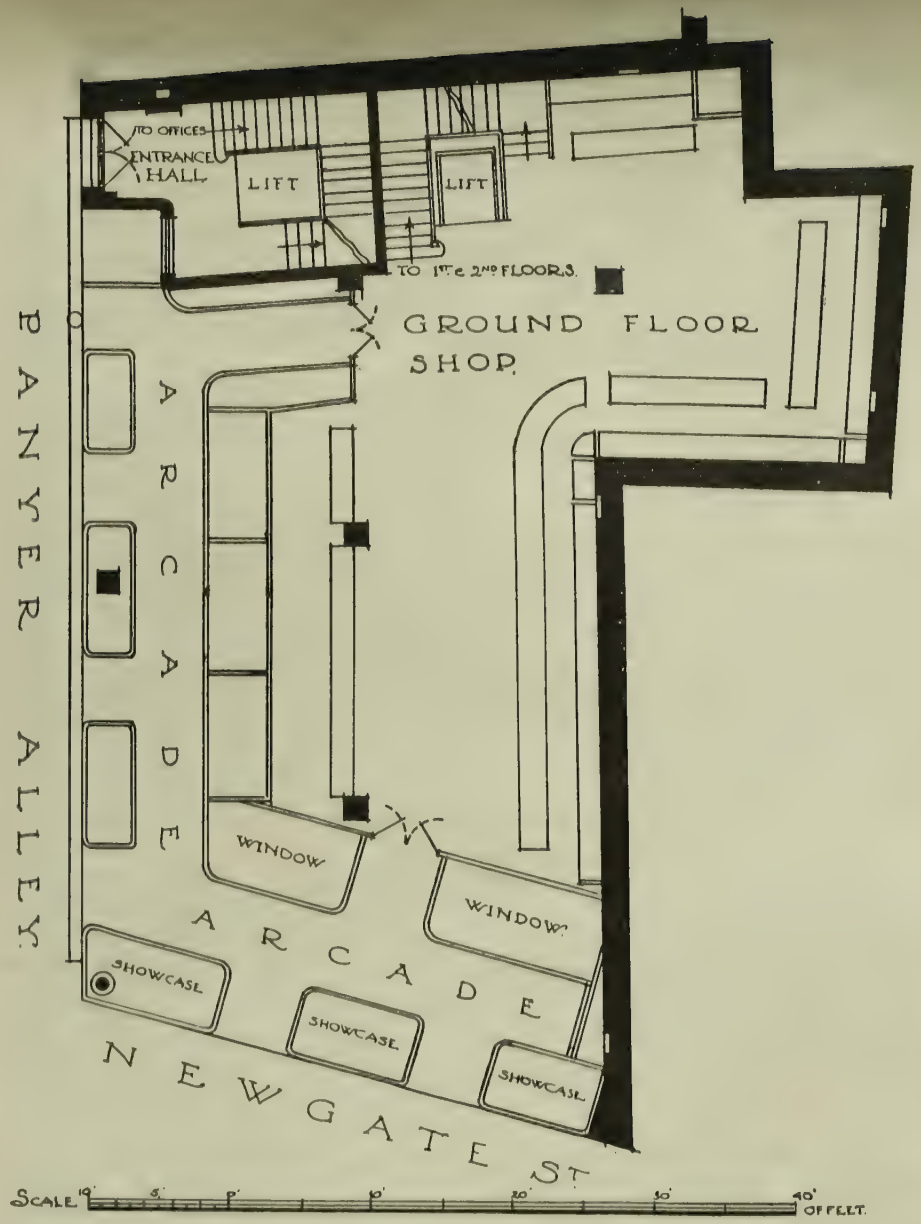
The House then referred to the First Schedule par. (*a*) (*b*) which prescribes the liability as to weekly payments and paragraph (3) which is as follows: "In the case of partial incapacity the weekly payment shall in no case exceed the difference between the amount of the average weekly earnings of the workman before the accident and the average weekly amount which he is earning or is able to earn in some suitable employment after or business after the accident. . . ." And then pointed out that this settles the extreme limit of what is to be paid, but it is a rider on the computation of the amount and not a statutory termination or interruption of the state of incapacity and when the words can no longer be applied then there is no bar to the right which the injured man has to be compensated for partial incapacity, and, applying this to the cases before the House the judgment proceeds: "In each case the features are first, partial incapacity found and compensation awarded; second suspension of the payment of compensation owing to the wages actually earned exceeding the pre-accident wage; and third wages actually earned fallen below the pre-accident wage. The right to compensation for partial incapacity then revives and the amount due in respect thereof involves inquiry as to what the man is competent to earn."



In considering this summary it is necessary to observe that it was pointed out that the existence or non-existence of a standing decree made no difference, which we understand to mean whether in the first instance the payments were made under an award or apart from an award.

Perhaps the chief importance of the decision lies in this, that the employers relied upon the fact that there had been no change in the condition of the workman himself, and a series of cases in which it was held that to allow of an application to review an award there must be a change of circumstances, and that a mere averment that a change has taken place in the labour market and the wages for partial employment have fallen is not sufficient, for the House not only distinguished those cases from these before it but indicated that they might have to be considered in the light of the decisi of that House in the case Macalinden *v.* Nimmo & Co. (1920, A.C. 39, *The Build* March 26, 1920).

In that case it was held that where a man h received an injury and an award had been ma for partial incapacity even though no physic change has occurred in his condition if it c be proved that the injury has had more effe on his chances in the labour market than w anticipated that may be a change of circu stances entitling him to a review.



Modern Developments in Town Planning.

Professor Patrick Abercrombie, M.A., the Department of Civic Design at Liverpo University gave a lecture recently at t Engineers' Institution, Cardiff, on this subje Mr. T. Alwyn Lloyd presided. The lectur appealed for the cultivation to a greater exte of the æsthetic element in modern tow planning. He contrasted such treatment t the method at present frequently adopted sweeping away all natural advantages, and h urged that where these advantages existe they should be taken advantage of. H instanced Cardiff Castle as a pleasing contra in the centre of the city. The lecture wa illustrated by lantern slides which showed ho ancient Greece had used the æsthetic element how some modern towns were doing so; an how others were failing.

Measured Drawing of the Old Blue Coat School, Liverpool.

[This measured drawing of the Old Blue Coat School, Liverpool, is by Mr. Cyril T. Whitfield (aged 16 years). The building was at one time used by the School of Architecture, but it is now occupied by offices and studios.]

THE BUILDING TRADE.

THE WORKMEN'S COMPENSATION ACT AS PASSED.

IN our issue for June 8 we gave a short summary of the provisions of the Government Bill amending the Workmen's Compensation Acts, and now the Bill itself, considerably amended, has become law, it is necessary to examine its provisions with greater precision.

War Additions.

Section 1 repeals the two War Addition Acts of 1917 and 1919, as from December 31, 1923, but there is a proviso as to the additions provided for in those Acts being continued. This proviso has been somewhat altered from the clause which appeared in the Bill, but only in form, and its effect is that the additions provided for in the War Additions Acts shall continue to apply to weekly payments payable to a workman under the Principal Act (the Act of 1906) or under any enactment superseded by that Act in respect of total incapacity arising from an accident which occurred on or before December 31, 1923, so long as the workman remains totally incapacitated, the addition being treated as if it were part of the weekly payment.

Payments on Death of Workman Leaving Children.

Section 2 has been considerably altered and it is as follows:—

"Where a workman leaves a widow or other member of his family (not being a child under the age of 15) wholly or partially dependent upon his earnings, and in addition leaves one or more children under the age of 15 so dependent, then (*a*) if both the widow or other member of the workman's family and such child or children as aforesaid were all wholly dependent upon the workman's earnings, there shall, in respect of each such child be added to and dealt with as part of the compensation payable under paragraph (1) (*a*) of the First Schedule to the Principal Act, a sum equal to 15 per cent. of the amount arrived at by multiplying the average weekly earnings of the workman, or where such earnings are less than £1 then by multiplying £1, or where such earnings exceed £2, then by multiplying £2, by the number of weeks in the period between the death of the workman and the date when the child will attain the age of 15, fractions of a week being disregarded; and (*b*) if the widow or other member of the workman's family or such child or children as aforesaid, or any of them, were partially dependent on the workman's earnings, there shall be paid as part of the compensation under the said paragraph such proportion of the sum which would have been payable under the foregoing paragraph of this section, if all such persons had been wholly dependent as may be agreed upon, or in default of agreement as may, taking into consideration the amount payable under the principal Act, be determined by arbitration under the principal Act to be reasonable, provided that the total amount of compensation payable to the dependants shall in no case exceed £600."

This section is much clearer than the clause in the Bill, but the percentage has been increased from 10 to 15 per cent. and the limit of compensation from £500 to £600.

Variations in Amounts of Compensation.

Section 3 increases the minimum amount of compensation payable in fatal cases. In the First Schedule of the principal Act, paragraph (1) in fatal cases the compensation is based on the average weekly earnings, but a minimum sum of £150 is prescribed; this section increases that minimum sum to £200.

Section 4, subsection (1) amends paragraph 1 (*b*) of the First Schedule of the principal Act by substituting thirty shillings for £1 as the maximum of the weekly payment in respect of total or partial incapacity.

Subsection (2) deals with total incapacity and provides that where the maximum weekly payment payable under the principal Act, as amended by the foregoing sub-section, is less than twenty-five shillings: "The workman shall be entitled during such incapacity to a weekly addition equal to one-half of the difference between such maximum weekly payment and the sum of twenty-five shillings or his average weekly earnings, whichever is the less and such addition shall for all the purposes of the principal Act be treated as if it were part of the weekly payment."

Subsection (3) relates to partial incapacity and the two paragraphs are so complicated we set them out in full.

"In the case of partial incapacity the weekly payment shall, subject to the provisions of paragraph (3) of the said Schedule, be of the following amount:

"(*a*) If the maximum weekly payment, had the incapacity been total incapacity, would have amounted to twenty-five shillings a week or upwards, the weekly payment in case of partial incapacity shall be one-half the difference between the amount of the average weekly earnings of the workman before the accident, and the average weekly amount which he is earning, or is able to earn, in some suitable employment or business after the accident.

"(*b*) If the maximum weekly payment would, had the incapacity been total incapacity, have amounted with such addition, if any, as is provided by subsection (2) of this section, to less than twenty-five shillings, the weekly payment in case of partial incapacity shall be a sum bearing the same proportion to the said difference as the said maximum weekly payment with such addition as aforesaid bears to the amount of the average weekly earnings of the workman before the accident."

It must be mentioned that paragraph 3 of the First Schedule referred to in this subsection provides that in the case of partial incapacity the weekly payment shall in no case exceed the difference between the amount of the average weekly earnings of the workman before the accident and the average weekly amount which he is earning or is able to earn in some suitable employment or business after the accident. The Workmen's Compensation Act was introduced as a measure of rustic justice, the idea being that every workman should be able to obtain compensation without legal assistance or with the minimum assistance. Parliamentary draughtsmen have wrought havoc with this idea, and probably no one would like to advise anyone what is the exact amount of compensation he is entitled to under the above provisions. If this is an example of legislation on rustic principles it is small wonder that a movement is on foot to throw open a University education to all classes, and even then we imagine many University men would prefer any examination paper to having to determine what is the amount of compensation due to an injured workman. Returning to this section of the Act, we may note that subsection (4) repeals the proviso (*b*) to paragraph (1) of the First Schedule of the principal Act which relates to workmen under 21 years of age. But in section 24 subsection (6) in the case of a review of weekly payments, the proviso to paragraph 16 of the First Schedule proviso 1 has been amended, and the proviso now reads:—"Provided that where a workman was at the date of the accident under 21 years of age and the review takes place more than 6 months after the accident and before the workman attains the age of 21 years the amount of the weekly payment may be increased to such an amount as would have been awarded if the workman had at the time of the accident been earning the weekly sum which would probably have been earning at the date of the review if he had remained uninjured."

Waiting Period.

Section 5 provides that compensation shall be payable if the injury disables the workman more than three days from earning full wages at the work at which he was employed, but that it shall not be payable in respect of the first three days on which he is so disabled unless the incapacity lasts for four weeks or upwards.

Certified Schemes.

Section 6 merely provides that if it appears to the Registrar of Friendly Societies that a certified scheme under section 3 subsection 1 of the principal Act no longer complies with the requirements of that section by reason of the foregoing provisions of this Act, it can be amended so as to make it not less favourable to the workman than the corresponding scales contained in the principal Act as amended by this Act. Section 17 contains a provision relating to the conditions on which schemes shall be received.

Accidents and Regulations.

Section 7 is a most important section. It provides that "for the purposes of the principal Act, an accident resulting in the death or serious and permanent disablement of a workman shall be deemed to arise out of and in the course of his employment, notwithstanding that the workman was, at the time when the accident happened, acting in contravention of any statutory or other regulation applicable to his employment, or of any orders given by or on behalf of his employer, or that he was acting without instructions from his employer, if such act was done by the workman for the purposes of and in connection with his employer's trade or business."

This is a very serious alteration in the law, and as we pointed out in our former article when the measure was a Bill (June 8), it will tend to discourage employers from issuing instructions intended solely to secure the safety of their workmen. It will be remembered that under section 1 subsection (2) (*c*) of the principal Act, the law was altered from what it was in the Act of 1897, as regards serious and wilful misconduct, by providing that when the accident results in "death or serious and permanent disablement" wilful misconduct is no qualification to the receipt of compensation. Of late years it has been held that the defence of serious and wilful misconduct can only apply where a man has been acting within the scope of his employment. (See our note to Bourton *v.* Beauchamp, June 25, 1920, and to Moore *v.* Donelly, May 27, 1921, both cases in the House of Lords), but where men have acted in contravention of statutory or other orders they have been held to have acted outside the scope of their employment, that is to say, the accident has been held not to have arisen "out of and in the course of their employment." The above cases and two others which we referred to in our issue of April 14, 1922, illustrate this.

This new section will have the effect of overriding those decisions so long as the man can be shown to have acted "for the purposes of and in connection with his employer's trade or business," and as a narrow construction is put upon the terms "serious and wilful misconduct" under the Act, it is difficult to see what check, if any, will exist so far as compensation is concerned in a workman acting exactly as he feels inclined to. This relaxation of the principle may have indirectly a very serious influence in increasing the risks of those engaged with their fellow workmen, and although undoubtedly there have been some hard cases to the in

nal it may be doubted whether it is a wise to countenance a disregard of statutory ther orders. The differentiation of the to compensation according to whether f the workman have serious consequences to the individual, as has been done in the f wilful misconduct and now is extended done contrary to regulations or orders, e based upon no principle, for at the time et of disobedience is committed the in- nal can have no idea of what the conse- es may be; but it is certainly less objection- where a man is furthering his employer's sts than where he is acting with wilful nduct.

Fishermen.

tion 8 amends the law contained in n 7 of the principal Act, as to crews of g vessels remunerated wholly or mainly hares.

Workmen.

tion 9 extends the definition of "work- " The expression is to include (*a*) persons g for hire with any vehicle or vessel, which tained from the owner under a contract ailment. other than a hire and purchase ment, the owner being for the purposes he Act then deemed to be an employer; rtain persons employed casually for games creation by clubs, in such cases the manager embers of the managing committee being "employer"; and (*c*) persons, not being ers, seamen or apprentices to the sea ce employed on ships mentioned in section 7 he principal Act, if so employed for the oses of the ship or any passengers or mails ey otherwise comply with the definition of rkman." A comma after the word ster" would make the section clearer, as ed in the Act.

Procedure.

ction 10 subsection (1) requires "under lty" notices to be posted up in a prescribed of the requirements of the Acts as to giving e of accidents and the making of claims the procedure to be adopted in the case of trial diseases.

bsection (2) deals with notices of accident ifying section 2 of the principal Act, to ollowing extent:—Want of, or any defect accuracy in, a notice of accident shall not bar to proceedings, if the employer is ed to have had knowledge of the accident any source at or about the time of the ent; or, where the employer is the owner mine or quarry, or the occupier of a factory orkshop (*a*) if such summary as above tioned in subsection (1) has not been posted (*b*) if the accident has been reported by or ehalf of the employer to an inspector of s or factories; (*c*) if the accident has been ed in any register of accidents kept by or ehalf of the employer at the mine, quarry, ry or workshop; (*d*) if the injury has been ed in an ambulance room at the above es.

subsection (3) notice of accident for the ose of section 2 of the principal Act, may iven either in writing or orally to the loyer or to any foreman or other official r whose supervision the workman is loyed, or to any person designated for the ose by the employer.

nd by subsection (4) in every mine, quarry, ry, or workshop a book in a prescribed shall be kept in which the prescribed iculars of accidents may be entered by the red workman, or some other person acting his behalf, and an entry in such book, if e as soon as practicable after the happening e accident, shall be sufficient notice of the lent for the purposes of the said section.

bsection (5) provides that the fact that a man has not given notice of an accident case where the necessity of giving such a e is dispensed with shall not deprive the loyer of his right under paragraph (4) of First Schedule of the principal Act to ire the injured workman to submit himself edical examination.

bsection (6) provides that for the purposes his section the expression "factory or workshop" includes any premises or works to which any of the provisions of the Factory and Workshops Acts, 1901 to 1920, apply, and the expression "prescribed" means prescribed by the Secretary of State.

It must here be pointed out that by section 30, sections 2 to 10, and any amendments in any scheme made in pursuance thereof do not apply to accidents happening before the commencement of this Act.

Section 11 contains some new provisions as to medical referees, but our space does not permit us to consider them here.

Agreements for Lump Sums.

Section 12 relates to recording agreements for lump sums, and this is very important since the decision of the House of Lords in the case of Russell *v.* Rudd, to which we called attention in our Legal Section, April 27, 1923. (See also section 21 below.) In that case it was decided that an agreement for the redemption of weekly payments by a lump sum can be registered although before that the amount of the weekly payment had not been ascertained by arbitration or agreement. This makes it very essential that agreements for lump sums should be carefully scrutinised, and this section now provides that where a memorandum of an agreement for the payment of a lump sum is, under the principal Act, sent for registration, the registrar, or if in pursuance of the principal Act, or this Act, the matter is referred to the judge, the judge shall have power, in accordance with rules of court (*a*) to require either party to furnish him either orally or in writing with such information as he may consider necessary, or to require the attendance of any parties to the agreement before him, and if the information appears insufficient, or conflicting, to require a report as to the workman's condition to be obtained from a medical referee. On failure on the part of either of the parties to comply with any requirement of the registrar under this subsection the registrar may refuse to record the memorandum and refer the matter to the judge, who shall have power to make such an order as he may think just. Where it appears from such report of the medical referee that the prospects of the workman's recovery from incapacity cannot as yet be approximately determined the registrar, or, on appeal, the judge, may refuse to record the memorandum.

There are provisions in this section that any such agreement shall disclose the amount, if any, paid or payable under, or in respect of, the agreement by the employer to the solicitor of the workman as costs, and power is given to the registrar to tax such costs; and there is also a very unusual provision enabling the approved society or committee by which sickness or disablement benefit, under the National Insurance Act, 1911, and the Acts amending that Act, payable to the workman is administered, to send to the registrar objections to the registration of any such agreement, and if attendance of any of the parties is required then the society or committee may also appear.

Section 13 enables an employer to agree that he is liable to pay compensation to a workman who claims to be suffering from an industrial disease without requiring the workman to obtain a certificate from the certifying surgeon, and a memorandum recording the agreement can be registered under paragraph (9) of the second Schedule of the principal Act.

Restrictions on Ending or Diminishing Payments.

Section 14 is extremely important as it introduces a change in the right of the employer to end or diminish weekly payments. Under paragraph 16 of the first Schedule of the principal Act, a weekly payment may be reviewed at the request either of the employer or of the workman, and on such review it may be either diminished or increased, and practically the only restriction has been that some change of circumstances must be shown to have taken place since the weekly payments were awarded.

Section 14 restricts the right of the employer as follows: "An employer shall not be entitled, otherwise than in pursuance of an agreement or arbitration, to end or diminish a weekly payment under the principal Act, except in the following cases (*a*) where a workman in receipt of weekly payments in respect of total incapacity has actually returned to work; (*b*) where the weekly earnings of a workman in receipt of a weekly payment in respect of partial incapacity have actually been increased; (*c*) where the medical practitioner who has examined the workman under paragraph 14 of the First Schedule of the principal Act, has certified that the workman has wholly or partially recovered, or that the incapacity is no longer due in whole or in part to the accident, and a copy of the certificate, together with notice of the intention of the employer at the end of ten clear days from the date of service of the notice to end or diminish the weekly payment by such amount as is stated in the notice, has been served by the employer upon the workman."

In this last-mentioned case, if within the ten days the workman sends to the employer the report of a duly qualified practitioner disagreeing with the certificate so served, the weekly payment shall not be ended or diminished except in accordance with such report, or if and so far as the employer disputes such report, except in accordance with the certificate of a medical referee in pursuance of paragraph 15 of the said Schedule as amended by this Act, then where an application has been made for such a reference under par. (15) there is a provision enabling payments to be made into court pending the settlement of the dispute.

The final sub-paragraph to this section is very precise, that "Nothing in this section shall be construed as authorising an employer to end or diminish a weekly payment in any case in which or to an extent to which, apart from this section, he would not be entitled to do so."

The words at the commencement of this section, "otherwise than in pursuance of an agreement or arbitration," appear to show that the practice as to review remains unaltered, but that except in the specified cases the weekly payments cannot be stopped or diminished *ipso facto* by the employer.

But in connection with this last section, section 15 has also to be considered, for it provides that "A weekly payment payable in respect of an injury happening after the commencement of this Act" (that is, January 1, 1924), "may, at any time after six months from the date of the accident, be reviewed, either at the request of the workman or of the employer, if it is claimed that had the workman remained uninjured and continued in the same class of employment as that in which he was employed at the date of the accident, the average weekly earnings of the workman during the twelve months immediately preceding the review, would, as the result of fluctuations in rates of remuneration have been greater or less by more than 20 per cent. than the average weekly earnings of the workman during the twelve months previous to the accident (or if the weekly payment has been previously varied on a review under this section during the twelve months previous to that review or the last of such reviews), and where such a claim as aforesaid is proved, the weekly payment shall be varied so as to make it such as it would have been if the rates of remuneration obtaining during the twelve months previous to the review had obtained during the twelve months previous to the accident." This section was not in the Bill.

The following section 16 is also new. It provides that if a workman who has so far recovered as to be fit for employment of a certain kind proves to the satisfaction of the judge of the county court (not, be it noticed, to the satisfaction of an arbitrator), that he has taken all reasonable steps to obtain and has failed to obtain such employment, and that his failure to obtain such employment is a consequence wholly or mainly of the injury, the judge shall order that his incapacity shall for the purposes of the principal Act continue to be treated as total incapacity for such period, and subject to such conditions as may be provided by the order without prejudice however to the right of review conferred by paragraph 16 of the First Schedule of the principal Act, but it is provided that

every such order shall be made subject to the condition that it shall cease to be in force if the workman receives unemployment benefit.

Right of Appeal.

Section 18 makes good an omission in the Bill which we deplored in our notice of the Bill (June 8), and embodies a recommendation contained in the Labour Party's Bill. In the case, Harrison *v.* Wythemore Colliery Co. (1922, 2 K.B. 674; *The Builder*, March 30, 1922), it was held by the Court of Appeal under section 1, sub-section (4) of the principal Act, that if in an action brought independently of the Act, to recover damages, the workman, on the failure of that action, exercised his option to have compensation assessed, the exercise of that option put an end to the action, and no appeal could be brought against the decision in the action. The section remodels section 1, sub-section (4) of the principal Act and is intended to give an appeal in such cases, and the option can be exercised either in the court below or in the appellate court. Our space does not permit us to mention in detail all the sections, so we pass over section 19, which introduces some amendments into section 5 of the principal Act, where bankruptcy of employers is the subject, and section 20 which relates to the detention of ships, and this brings us to another section not in the original Bill, section 21.

Registration of Agreements Compromising Claims.

In the case Russell *v.* Rudd in the House of Lords, which we noted April 27, 1923, very difficult questions were raised in connection with an agreement to pay a lump sum compromising any further claim after weekly payments had been made to a workman voluntarily without any proceedings and without formal agreement.

Section 21 seems directed to dealing with some of the questions raised in that case. It provides that where after the commencement of this Act, the person against whom a claim for compensation is made disputes his liability but makes an agreement "whereby in consideration of the payment of a lump sum the claim for such compensation purports to be precluded" the agreement shall be sent for registration as in the case of an agreement for the redemption of weekly payment by a lump sum, and the employer shall not be exempt from liability until the agreement is registered. In considering whether the lump sum is adequate the registrar or the judge shall have regard to the question whether or not liability to pay compensation under the principal Act is doubtful.

Partial Dependency.

Section 22 provides that for the purposes of the principal Act, a person shall not be deemed to be a partial dependant of another person unless he was dependent partially on contributions from that person for the provision of the ordinary necessities of life suitable for persons in his class and position.

Poor Law Relief.

Section 23 contains provisions where an authority has paid out-door relief to a person pending a settlement of his claim to compensation enabling the authority to claim the sums so paid or part of them from the employer. This section it appears to us is not well drawn, and difficulties may arise between the employer and the authority, both as to the question of the liability to the claim for compensation, and the amount due to the authority.

The above is only a brief and incomplete summary of the main provisions of this very complicated Act, and it will be seen that far from simplifying the law it rather complicates it, for apart from the drafting of the Act, it alters the law as contained in some decided cases, and litigation will result in determining to what extent the case law is modified. We cannot but think that the legislature would have a little simplified matters if the principle adopted in the Labour Party's Bill had been followed, of codifying the law in one Statute, as that would have enabled the effect of the amendments more readily to be ascertained.

THE LATE F. J. DOVE.

MR. FREDERICK JOHN DOVE, of Messrs. Dove Brothers, Islington, who passed away on the 18th inst., at the ripe age of 93, was the doyen of the London building trade, and came of a long line of builders. He was born in Islington and well remembered the mail coaches passing along Liverpool-road *en route* from St. Martin's-le-Grand to the north, and open fields interspersed with a few scattered blocks of houses such as Highbury-terrace, Stoke Newington Green, etc., extending from the City-road northwards.

He was educated at the private school of Darnel, a well-known pedagogue of 90 years ago, which had a profound belief in the efficiency of the rod. At a very early age Mr. Dove developed a great ability for drawing and mathematics. After leaving school, and whilst learning the practical side of the trade during the daytime, he attended in the evenings the old School of Design in Somerset House, subsequently for some time studying architecture in the office of Mr. Alex. D. Gough. In the early fifties of the last century he joined his brothers in carrying on the business founded by his father, the late William Spencer Dove.

Very early in his career he took a very keen interest in all matters appertaining to the welfare and organisation of the industry, and was the last survivor of the original founders of the London Master Builders' Association. He was associated with most of the difficulties which occurred in the trade from fifty to twenty years ago, and exercised a powerful influence in moderating the acrimony of the disputes, the workmen and his colleagues regarding his judgment as sound and equitable.

He was for three years (1882 to 1885) President of the L.M.B.A., a member of the old Builders' Society, out of which the L of Builders was formed, and President latter body in 1893, a Trustee and Pr in 1879 of the Builders' Benevolent tion, a Trustee and Treasurer of th vident Institute of Builders' Foreme Clerks of Works, and one of the fo and Vice-President of the Builders' dent Insurance Company, and until years ago an active member of the Bo Directors. He was on the Court and Master of the Tylers' and Bricklayers' pany, Treasurer of the Islington Dispe and a Vice-President of the Orphan W School, in both of which institutions h a very keen interest.

He took an active part in the busin which he was the chief partner until af eightieth year. The majority of the ch built and restored by the firm, totalling hundreds, were carried out under his vision, the building of which he wa ticularly proud being the Priory Church Bartholomew's, Smithfield, the restorat which has been spread over some fifty Other works with which he was intir associated were the foundations of the Courts: St. Mary Abbots Church, Ke ton; the Law Courts Branch of the Ba England; the Wesleyan Central Hall; minster; numerous commercial buildin the City, and country mansions. He m in 1854 Marian Ann, the second daugh Mr. Lionel Prime, builder, of Islington had four sons, the eldest of whom is m ing director of the company, two of his g sons being also in the business.

The interment took place on Saturda in the Old Cemetery, Highgate, after a vice in the Church of St. Mary's, Ho Rise, of which church Mr. Dove was for time warden.

The late Mr. F. J. Dove.

EXPANSION OF BUILDING AND CONSTRUCTION IN INDIA.

LOCAL SELLING RATES.—These may prove interesting to tenderers. Local official orders have been recently filled by contractors as follows:—At Calcutta: 1,000 ft. 5 in. W.I. water pipes, Rs.2,437½; 2,000 ft. 2½ in. ditto, Rs.2,000; apparatus for testing various vacuum brake gear, Rs.7,300; two platform weighing machines, 1 ton capacity, 3 ft. by 3 ft., without track rails, total Rs.1,300; 16 steelyards, weighing 1 to 300 lbs., total Rs.1,360; 315 rolls milled sheet lead, 6 lbs. to square ft. in rolls 30 ft. by 15 in., total Rs.13,504; 1,590 plain galvanised sheets, iron, 8 ft. by 4 ft. by 22 B.W.G., total Rs.10,877. At Delhi: 2,808 ft. 6 in. W.I. water pipes, Rs.6,687; 8,000 ft. 2½ in. ditto, Rs.7,524; one 10 h.p. motor and central gear, Rs.1,775. At Bombay: one petrol gas generating plant, Rs.6,356; four 24 in. gauge locomotives, total Rs.64,800; one 5-ton portable crane, Rs.5,500. At Karachi: 20 tons galvanised iron corrugated sheets, 26 B.W.G., Rs.8,100; 2 sets No. 3 concrete mixers, complete with motors and spares, Rs.124,380, &c.

INDIAN MADE GOODS.—It is pointed out that industries newly started in India cannot in the initial stage compete against established industries in Britain. Recently a tender was put out, and 44 tenders were received from India, England, Belgium, America, Canada, France, and Holland. The lowest Indian tender was 9 per cent. higher than the lowest English tender, even with the addition of c.i.f. charges and Customs duty. The order, valued at many thousands of pounds, was sent to England.

INDIAN PROJECTS.—The Chief Commissioner, Delhi Province, invites offers for the perpetual leasehold of two hotel sites on Queensway, in the new capital area at Delhi. Size and type of hotels to be erected and date ready to open to be stated.

PHARENDA NAUTANWA EXTENSION.—Construction of a railway on the metre gauge from Pharenda station, 25 to 26 miles, *via* Lachmipur and Naikot to Nautanwa, as an integral part of the Bengal & North-Western Railway.

The project of establishing a port on the Orissa coast is receiving attention.

ROAD MAKING.

ON December 14 Col. C. H. Bressey gave a further lecture on this subject at the College of State Management.

The lecturer dealt with the most modern methods of road construction now being used on arterial roads, including tar macadam, pitch grouted macadam, rock asphalte, asphaltic macadam and concrete.

Tar macadam, he said, was particularly valuable where only a low grade stone was obtainable. Slag had a special affinity for tar and made an excellent material, whereas without tar it would be very inferior. The method of pitch grouting introduced by Mr. Brodie was more dependent upon weather conditions than tar macadam.

Rock asphalte was the best, but most expensive, surfacing material, and was only suitable where there was a large volume of traffic, as, unless it was kept well used, it deteriorated. To get the same result at less cost asphaltic macadam, of broken limestone or clinker between, was now being used.

The use of concrete as a surface material allowed of a wide range of road materials, and whereas good road stone was not easily obtainable in the south-east of England, there were few districts in the country where a stone or gravel suitable for concrete was not obtainable at a reasonable cost. To get a satisfactory result bare sufficiency of water should be used, the materials mixed by machinery, and placed in position as quickly as possible, and kept moist for at least fourteen days. This sufficiency was more suitable for new roads than for old, as traffic must be kept off for three weeks or more after the concrete was placed in position.

Samples of various reinforcements were exhibited and the method of laying them described.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½

(For rates of wages in the Building Trade in Scotland, see page 1014.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

DECEMBER 28.—**Eastbourne.**—CHIMNEY.—Erection of a brick chimney (60 ft. high) at the Eastbourne Union, 123, Church-street, Eastbourne, for the Guardians. Mr. Fredk. G. Cooke, Assoc.M.Inst.C.E., M.S.A. architect, 2, Hyde Gardens, Eastbourne. Deposit £1 1s.

DECEMBER 28.—**London, N.**—TELEPHONE EXCHANGE.—Erection of a telephone exchange at Palmer's Green, London, N., for the Commissioners of His Majesty's Office of Works. Contracts Branch, H.M.O.W., King Charles-street, London, S.W.1. Deposit £1 1s. (payable to the Secretary).

DECEMBER 28.—**Manchester.**—SORTING OFFICE AND TELEPHONE EXCHANGE.—Erection of a sorting office and telephone exchange at Openshaw, Manchester, for the Commissioners of His Majesty's Office of Works. Contracts Branch, H.M.O.W., King Charles-street, London, S.W.1. Deposit £1 1s. (payable to the Secretary).

DECEMBER 28.—**Newport (Mon).**—VARIOUS WORKS.—For erecting, for the B.C. Parks Committee, a tennis pavilion, public shelter and public convenience at Crindau Park, Newport. Borough Engineer, Municipal Chambers, Corn-street, Newport. Deposit £1 1s.

DECEMBER 28.—**Southampton.**—HOSTEL, &C.—Contract No. 1: The erection of a hostel for 45 students (deposit £5 5s.); (2) For the construction of ferro-concrete floors, stairs and flat roofs to the hostel, "Coignet" system (deposit £2 2s.), for the County Borough of Southampton. Mr. A. L. Roberts, County Architect, The Castle, Winchester. Cheques to be made payable and crossed "Lloyds Bank, Ltd. (Capital and Counties Branch), Winchester."

DECEMBER 29.—**Bradford.**—HOUSES.—Housing Scheme No. 12, Lower Grange, Thornton-road, erection of 20 houses, Class "A"; two houses, Class "B." (1) Contractors may tender for separate trades, or for the whole of the works in all trades complete; (2) the tenders shall be based upon fixed prices for labour and materials, for the City of Bradford. Office of the City Architect; Town Hall, Bradford.

DECEMBER 29.—**Ennis.**—REBUILDING.—For the partial restoration of Ennis Civic Guard Barrack, co. Clare. Mr. J. J. Healy, Secretary, Office of Public Works, Dublin. Deposit £1.

DECEMBER 29.—**Harrogate.**—SHED.—Erection of store shed, for the T.C. Mr. C. E. Rivers, Borough Surveyor, Harrogate.

DECEMBER 29.—**Salford.**—ADDITIONS.—For additions to Union Infirmary, Pendleton, for the Board of Guardians. Mr. E. H. Inchley, Clerk, Offices, Eccles New-road, Salford. Deposit £2 2s.

DECEMBER 31.—**Liverpool.**—CHAPEL.—Erection of new Chapel, Earlsfield-road. Mr. Owen Owens, 362, Smithdown-road, Liverpool.

DECEMBER 31.—**Monmouthshire.**—BUILDING AND DRAINAGE.—For the following works, for the Monmouthshire Agricultural Committee:—(1) Erection of a set of farm buildings on holding No. 9, at Great House Farm, Caerwent; (2) general repairs and new drainage at Broadwell Farm, Mathern, near Chepstow. Mr. A. Every-Clayton, County Land Agent, 2, Gold Tops, Newport (Mon).

DECEMBER 31.—**Nottingham.**—GARAGE.—For enclosing the stable yard for a garage at Bagthorpe Institution, for the B.G. Messrs. Ernest R. Sutton & Son, architects, Albion Chambers, King-street, Nottingham.

DECEMBER 31.—**Oldbury.**—HOUSES.—Erection of 20 houses in Queen's-road, Londonderry, for U.D.C. Mr. R. Fletcher, Surveyor, Public Buildings, Oldbury. Deposit £2 2s.

DECEMBER 31.—**Owenbeg, co. Sligo.**—EXTENSION.—For extension of Owenbeg National School, co. Sligo, for Commissioners of Public Works. Very Rev. M. J. Canon Tully, P.P., Easkey, co. Sligo.

DECEMBER 31.—**Pontefract.**—HOUSES.—Erection of 24 houses at Willow Park and 10 at Wakefield-road, for the T.C. Mr. J. E. Pickard, Borough Surveyor, Pontefract. Deposit £2 2s.

DECEMBER 31.—**Rhymney.**—CONVERSION.—For carrying out, for the Monmouthshire Education Committee, the alterations necessary to "The Lawns," Rhymney, to convert same into a central school. Hours and wages conditions in contract. Mr. John Bain, Architect, County Hall, Newport (Mon).

DECEMBER 31.—**Upton Cross.**—PAINTING, &C.—For renovation of the Wesleyan Chapel. Mr. T. Shovel, Upton Cross.

DECEMBER 31.—**Brentford.**—COTTAGE, &C.—For erection of caretaker's cottage and coach-house, at the Isolation Hospital, for the U.D.C. Mr. J. W. Westlake, Surveyor, Council House, Brentford.

JANUARY 1.—**Barnet.**—HOUSES.—Erection of 23 houses at a net inclusive cost of £350 or thereabouts, for the Barnet U.D.C. Contractors can submit their own designs and specifications, or they can quote on the scheme prepared by the Council. Engineer and Surveyor, Council Offices, Wood-street, Barnet.

JANUARY 1.—**Cardiff.**—ALTERATIONS.—For alterations at 2, Neville-street, for Cardiff Board of Guardians. Messrs. Willmott & Smith, 4, Park-place, Cardiff. Deposit £2 2s.

JANUARY 1.—**Newtown.**—BUILDER'S WORK.—For execution of builder's work required in connection with heating installation, &c., at the Workhouse, for the Board of Guardians. Messrs. Davies & Hill, architects, Newtown.

JANUARY 1.—**Ryde, I. of W.**—PAVILION.—Erection of a pavilion in the Esplanade Gardens, Ryde, I. of W., for the B.C. of Ryde. Messrs. Vincent & West, 20, Portland-street, Southampton. Deposit £2 2s.

JANUARY 1.—**Thornton Rust.**—HOUSE.—Erection of a detached house, Thornton Rust, near Aysgarth, for Dr. J. Hutchinson Wood. Mr. P. J. Lucas, architect, 8, King William-street, Strand, W.C. 2.

JANUARY 1.—**Tonbridge.**—HOUSES.—Erection of two or six pairs of houses, for the U.D.C. Mr. W. L. Bradley, surveyor, Tonbridge Castle. Deposit £1 1s.

JANUARY 1.—**Watford.**—COTTAGE.—Erection of cottage on the Radlett Outfall site, Oakridge-lane, in parish of St. Stephen, for R.D.C. Surveyor, 9, Market-place, Watford. Deposit £2.

JANUARY 1.—**York.**—HOUSES.—Erection of 86 houses of the non-parlour type in blocks as follows:—One block of 2, one block of 5, 16 blocks of 4, and five blocks of 3, at their Heworth Housing Estate, York, for the Housing Committee of the York Corporation. Diaries for 1924.

Pocket diaries specially produced for the business man, the motorist, the engineer, the gardener and poultry keeper, the wireless enthusiast, the housewife, the schoolboy and schoolgirl, the Boy Scout and Girl Guide, are all included in the 1924 editions of Messrs. Charles Letts & Co.'s well-known series of diaries. There are also desk pads, large desk "scribbling" diaries, wall calendars, large loose-leaf diaries, and plain pocket-diaries, in great variety, so that it should not be a difficult matter for the most fastidious to select a diary suited to his special needs from Messrs. Letts's publications; in fact, it seems the only difficulty which might arise is in making a choice from amongst so many admirable productions. The binding and production are of the excellent quality associated with this firm's productions, and the memoranda given should be of great value to those for whom it is intended.

The Cinematograph Industry.

An exhibition at the new headquarters of Messrs. J. Springer, Ltd., 152-158, Wardour-street, W.1, was opened on December 17. There may be seen everything connected with the cinematograph industry, giving the maximum of service at the minimum of cost, evidence of which is forthcoming in the new Springer projector, which is available at a very low figure. The showrooms are decorated throughout with "Ornastele," a new British production of compressed steel. This embossed metal, resembling lincrusta, is very effective, and may be easily fixed to the ceiling and walls, quickly converting a bare building into an elaborately decorated picturehouse; it is fire-resisting and damp-proof and can be painted to suit any colour scheme. Equipment for construction, reconstruction, furnishing and outfitting of the cinema, from a complete projection plant down to the smallest every-day want of the exhibitor, is to be found at this emporium.

COMPETITIONS & CONTRACTS.

(*Continued from page 1015.*)

JANUARY 1.—**Ealing.**—ROADS.—Formation of new road, connecting Gunnersbury-avenue with Gunnersbury-lane, and the improvement of Windmill-road, for the B.C. Mr. W. R. Hicks, Borough Engineer, Town Hall, Ealing. Deposit £1 1s.

NEW BUILDINGS IN SCOTLAND.

Dundee.—The Dundee Education Authority has decided to purchase Ashcliffe House, the site in Perth-road being suggested as suitable for the erection of a new Harris Academy. It is stated that the purchase price is about £3,000.

Thornton.—The Kirkcaldy District Committee of the Fife County Council has agreed to sell a portion of the housing site at Thornton to a syndicate for £300. on the understanding that the ground is used for the erection of houses, and that the lay-out prepared by the District Committee's architect is adhered to.

Airdrie.—The Lanarkshire Education Authority has authorised the extension of the Manual Instruction Department at the Academy Secondary School. The estimated cost is £5,700.

Musselburgh.—The Town Council propose to submit plans to the Board of Health for the erection of 28 houses at Monktonhall.

New Monkland.—The Lanarkshire Education Authority has forwarded plans to the Scottish Education Department for their approval of a special school for invalid children for Old and New Monkland areas.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations :—T.C. for Town Council; U.D.C. for Urban District Council: R.D.C for Rural District Council: E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERYSTWYTH.—Plans have been passed by B.C. for alterations and additions to Pier Pavilion. As result of Ministry of Health public inquiry the T.C. has received sanction to loan of £12,270 for sewerage scheme. The Channel Excursion Steamers, Ltd., have put forward an Aberystwyth service scheme to T.C. It will entail construction of landing stage at estimated cost £4,000 to £5,000, and company suggests a loan of amount from G.W.R. Co. The Council is examining proposals.

AMMANFORD.—Sanction has been received by U.D.C. to borrow £17,460 for acquisition of electric light undertaking. The Council has decided to proceed with erection of new reservoir, to hold 200,000 gallons, at estimated cost of £3,800, and to lay duplicate line of water mains at estimated cost £3,500.

BEDFORD.—Plans passed by T.C.: Mr. E. H. C. Inskip, outbuildings, Kimbolton-road; Simplex Works, lavatory and cloak room, Elstow-road; Mr. H. Bowler, two houses, Tennyson-road.

BELFAST.—Plans passed by T.C.: Six houses, Luxor-gardens, for J. McMillan; house, Balmoral-avenue, for N. McNaughton; 4 houses, Kilhorne-gardens, for R. J. & F. Kerr; alterations, Chichester-street, for W. Brown & Sons; 5 houses and shop and house, Beechmount-avenue, for the Belfast Building Guild, Ltd.; rebuilding premises at rear of Royal-avenue, for the trustees of the late J. Johnston; shop and houses, Newtownards-road, for Wm. McNelly; shop and house, Divis-street, for Mrs. A. Hadly; shop and house, Abingdon-street, for J. H. Dowling; 3 houses, Park-road, for R. McIntyre; house, Kincora-avenue, for W. & J. Robinson; shop and stores, Old Park-road, for A. M. Dougan; shop and house, Elm-street, for J. R. McKenna; 2 houses, Wandsworth-road, for G. Mercer; shop and house, Cliftonville-road and Oldpark-avenue, for H. & W. Pollock; shop and house, Grosvenor-road, for A. D. Forde; additions to factory, Cupar-street, for Messrs. J. & T. Greeves; shop and house, Grosvenor-road, for Mr. A. Ford (architect, Mr. J. W. C. Porte); 2 semi-detached villas, Oldpark-road, for Mr. A. E. Fair (architect, Mr. Thomas Houston); villa, Sandown-road, for Mrs. V. Neill (architects, Messrs. Taggart & Silk); shop and house, Woodstock-road, for Mr. John Crawford (architect, Mr. R. Lynn); stores and engine house, Sydenham-road, for Mr. M. Hamilton Bodel (architect, Mr. Wm. Crook); classrooms, University-road and College-gardens, for the Governors of the Methodist College (architects, Messrs. Hobart & Heron); 2 semi-detached villas, North-road, for Mr. George Mercer; house, Finvoy-street, for the East Belfast Building Society; addition to store, Duncrue-street, for Mr. Wm. Davidson (architects, Messrs. Munce & Kennedy); 6 semi-detached villas, Sandown-road, for Mr. Wm. Evans; villa, Balmoral-avenue, for Mr. A. W. Stewart (architect, Mr. John Seeds); villa and motor garage, Newforge-lane, for Mr. T. B. Johnston (architects, Messrs. Tulloch & Fitzsimon).

BRECON.—The Ministry of Health has agreed, upon conditions, to make grant to cost of T.C. high-level water scheme. The Surveyor has reported imperative need of renewal of filter beds, estimate £1,000. Tenders are to be invited by T.C. for erection of ladies' lavatories.

BRISTOL.—The T.C. has adopted a report of the Docks Committee recommending the construction and equipment of the eastern arm of Royal Edward Dock, Avonmouth, at a cost of £1,000,000.

CARMARTHENSHIRE.—The Llandovery Town Council has applied to Ministry of Health for sanction to erect 50 houses to replace uninhabitable dwellings.—The Carmarthen Town Council has applied to Government for sanction to use and convert the prison, disused under 1922 Prisons scheme, into dwellings. The Council has further decided to consider scheme for extension of roadway over Town bridge, and repairs necessary to bridge. Grants for same, as bridge is main way to West Wales, are expected from G.W.R. Co., Ministry of Transport, and County Council.—The Llanelly B.C. is to grant site at Llanerch for erection of 52 houses under G.W.R. employees housing scheme. The Council Education Committee wishes part of Llanerch site to erect new school.

CLAYGATE.—Plans passed: Messrs. Trollope & Colls, 28 houses.

CLITHEROE.—Mr. M. K. North, an official of the Ministry of Health, has conducted an inquiry into an application by the R.D.C. for sanction to borrow £630 for the purpose of connecting the village of Wiswell with the sewerage works at Barrow. There was no opposition.

CRICKHOWELL.—The Board of Guardians has decided to invite tenders for reconstruction of brick bakery system, and is to consider installation of new steam bakery.

DUBLIN.—Plans passed: Re-building 98, Upper Church-street, for Mr. Francis O'Hanlon; 2 cottages, Strandville-avenue, North Strand, for Miss Ryan.

EBBW VALE.—The U.D.C. Education Committee has submitted scheme and estimate of expenditure of £30,000 on additional school accommodation provision in the New Year to Board of Education for sanction. A new school on Gautre site is included in scheme, and Markets School is to be reconstructed. Additions to present premises alone are estimated at £4,000.

EPSOM.—Plans have been approved by the R.D.C. for a house at Spa Bottom, Fairmile Heath, for Mr. H. Bull.

GATESHEAD.—A scheme has been commenced for the erection of new Sunday school premises for the Bensham-road Wesleyan Church.

GLAMORGANSHIRE.—The renovation of the Church Hall, Creigiau, will shortly be undertaken. The workshops of the Pont-Rhondda Institute for the Blind are shortly to be extended; a grant of £400 toward the cost has been received from the Arthur Pearson Memorial Fund. The Ministry of Transport has made grants of 50 per cent. of cost of Caerphilly road-widening scheme, estimate £9,000, and Radyr road diversion, estimate £9,000, to be put in hand by Cardiff B.C., and for widening Duke-street—Castle-street, estimate £16,000, by the same authority. The C.C. is to construct new road into Aberdare Valleys, alongside Glamorgan Canal, which is to include a viaduct construction across the valley at Abercynon. It was reported at a meeting of the Penarth U.D.C. that £5,000 had been earmarked by Roads Board for improvement of Cogau Hill. Applications will be considered at next meeting of Council for sanctions to erect 30 houses at Pyle. The Council of the South Wales and Mon University College at Cardiff have decided in view of success of their appeal for £250,000, to proceed with new University building at Cathays Park, Cardiff, and has instructed preparation of plans, bills of quantities, &c., for major portion of new buildings, including chemistry and physics laboratories. The foundations for buildings are already prepared.

GORSEINON.—Tenders are to be invited for the reconstruction of Gorseinon bridge by the Swansea R.D.C. The question of forming and equipment of a fire brigade is being considered by Council.

KING'S LYNN.—Plans passed by T.C.: Lay-out plan of building estate, Tennyson-avenue, for Messrs. Perkins & Collins.

LEADGATE.—The U.D.C. have approved plans submitted by the Consett Iron Co., Ltd., for the erection of 157 houses.

LITTLEHAMPTON.—The U.D.C. has approved of the plans for a new fire station, &c., at an estimated cost of £1,500.

LONDON (BERMONDSEY).—Sanction has been given to the B.C. by the L.C.C. to borrow £21,497 for paving and sewer works.

LONDON (BETHNAL GREEN).—The B.C. has received sanction from the L.C.C. to borrow £9,491 for sewer reconstruction and paving works.

LONDON (LEWISHAM)—Plans passed by B.C.: A. Durbin, 3 houses, Baring-road; G. W. Smith & Son, re-drainage, 123 & 123A, High-street and 24, Lewisgrove; H. Woodham & Sons, 20 garages, Blythe-vale; Clarke & Hampton, 2 houses, Baring-road; P. J. Waller, 3 garages, Devonshire-road; H. R. Watt, 10 houses and garages, Bromley-road; Young & Hall, rebuilding of "Bricklayers' Arms," High-street, Sydenham; F. W. Kiddie, bungalow, Baring-road; W. Doddington, addition to biscuit factory, Manor-lane.

MONMOUTHSHIRE.—Grant of 50 per cent. has been promised County Council of cost (estimate £5,000) of widening Usk–Crumlin road. The Monmouth Board of Guardians have received plans for proposed extension of workhouse casual wards.

NEWPORT (MON)—The Borough Engineer has been instructed to investigate sites for proposed new Town Hall, and also the extension of existing building. The T.C. is considering the building of a crematorium.

PEMBROKESHIRE.—Estimates have been submitted to Haverfordwest R.D.C. for proposed work of reconstruction of Dale-Milford road. The amount is £16,212, and grant has been applied for. The G.W.R. Co. has notified Tenby T.C. that it wishes to put in hand immediately the construction of approaches to the golf links.

PENARTH.—A deputation of the U.D.C. has waited on Ministry of Health for sanction to proceed immediately with erection of pavilion and grand stand on R.F.C. ground, which is to be rented to the club.

PLYMOUTH.—The Corporation are to erect at once additional houses at Prince Rock and North Prospect. Tenders are being invited for the building of 28 houses of the two-flat type at Prince Rock, at an estimated cost of £17,920, and tenders are being accepted for 72 houses at North Prospect, at a cost of £29,780, and 120 houses at the same place, at a cost of £55,520.

RHAYADER.—The Rhayader R.D.C. having received assurance of free land and haulage, has decided to expend £800 on reconstruction of portion of Pant-y dwr-road.

SHEFFIELD.—Plans passed by T.C.: Two houses, Springhouse-road, for Mr. W. Lynch; house and garage, Millhouses-lane, for Mr. W. B. Barber; three houses, Silver Hill-road, for Mr. J. A. Wragg; house, Trap-lane, for Mr. J. Higginbottom; house, Rundle-road, for Mr. Alexandra Downie.——The Education Committee are submitting plans and estimates to the Board of Education for their approval for the proposed extensions to Firth Park Secondary School. The plans make provision for 10 additional classrooms, an assembly hall to accommodate 447 scholars, a gallery to accommodate 70 scholars, and a platform to accommodate 31 scholars. Provision is also made for two large science laboratories and two lecture rooms, in addition to the conversion of block of stables into two dining rooms, enlargement of kitchen with the necessary stores and larder. Cloak-room and lavatory accommodation is being provided for 516 scholars. The estimated cost of these extensions, which are one-story high, is £28,460 if carried out in brickwork, but if stone is used the cost will be about £30,000.
